It is the policy of OMEGA to comply with all worldwide safety and EMC/EMI regulations that apply. OMEGA is constantly pursuing certification of its products to the European New Approach Directives. OMEGA will add the CE mark to every appropriate device upon certification.

The information contained in this document is believed to be correct but OMEGA Engineering, Inc. accepts no liability for any errors it contains, and reserves the right to alter specifications without notice.

WARNING: These products are not designed for use in, and should not be used for, patient connected applications.
CN130 Digital Controller
Operating Instructions

Thank you for having selected the CN130 Series digital controller. Read these instructions carefully to ensure correct operation the the product. If you have any questions, contact our sales representative or your nearest sales office.

Please ensure that this instruction manual is given to the final user of the instrument.

This instruction manual is meant for those who will be involved in the wiring, installation, operation and routine maintenance of the series. This manual describes the care, installation, wiring, function, and proper procedures for the operation of series. Keep this manual at the work site during operation of series. While using this instrument, you should always follow the guidance provided herein.

1. The Matters regarding Safety

For matters, regarding safety, potential damage to equipment and/or facilities, additional instructions are indicated by the following headings:

**WARNING**

Exercise extreme caution as indicated. This heading indicates hazardous conditions that could cause injury or death of personnel.

**CAUTION**

Exercise extreme caution as indicated. This heading indicates hazardous conditions that could cause damage to equipment and/or facilities.

**NOTE**

This heading indicates additional instructions and/or notes.

The mark ☢ designates a protective conductor terminal. Make sure to properly ground it.

**WARNING**

The series controller is designed for controlling temperature, humidity and other physical subjects. It must not be used in any way that may adversely affect the safety, health or working conditions of those who come into contact with the effects of its usage. When used, adequate and effective safety countermeasures must be provided at all times. No warranty, express or implied, is valid in the case of using this product without the use of proper safety countermeasures correspondingly.

**CAUTION**

To avoid damage to the connected equipment, facilities or the product itself due to a fault of the product, safety countermeasure must be taken before usage, such as proper installation of the fuse and the overheating protection device. No warranty, express or implied, is valid in the case of using this product without having implemented proper safety countermeasures correspondingly.

**CAUTION**

- The ☢ mark on the plate affixed to the instrument: On the terminal nameplate affixed to the case of your instrument, the ☢ mark is printed. This is to warn you of the risk of electrical shock which may result if the charger is touched while it is energized.
- A means to allow the power to be turned off, such as a switch or a breaker, should be installed in the external power circuit to be connected to the power terminal of the instrument. Fix the switch or the breaker adjacently to the instrument in a position which allows it to be operated with ease, and with an indication that it is a means of turning the power off. The switch or the breaker should meet the requirements of IEC 947.
2. Specifications

■ Display

- Digital display: 7 segments / Measured value (PV)
  Red LED 4 digits, Set value (SV)
  Green LED 4 digits

- Display accuracy: ± (1/3% FS + 1 digit)
  Refer to Table of Measuring Range Codes.

- Display accuracy range: 23 ± 5°C

- Display resolution: Depends on measuring range
  (0.001, 0.01, 0.1, 1)

- Sampling cycle: 0.25 sec.

- Action display / colors: 7-type LED lamp indication:
  Control output (OUT) / Green, Higher limit
  alarm action (AH) / Red, Lower limit
  alarm action (AL) / Red, Event / Heater
  break alarm action (EV/HB) / Red, Auto
  tuning (AT) / Green, Manual control
  (MAN) / Red, Set value bias (SB) / Green

■ Setting

- Setting: By 6 front key switches

- Setting range: Same as the measuring range

- Setting limit: Higher / lower limits individual setting as desired within measuring range (lower limit value < higher limit value)

■ Input

  (Multi input, multi range: Refer to Table of Measuring Range Codes.)

- External resistance: 100Ω max.

- Input impedance: 500kΩ min.

- Burnout: Standard feature (up scale)

- Cold junction temperature compensation accuracy: ± 2°C (5~45°C)

- R.T.D.: JIS Pt100 / JP1000 3-wire type
  (Multi range: Refer to Table of Measuring Range Codes.)

- Amperage: Approx. 0.25mA

- Lead wire tolerable resistance: 5Ω max. / wire

- Voltage:
  -10~10, 0~10, 0~20, 0~50, 10~50, 0~100mV DC or -1~1, 0~1, 0~2, 0~5, 1~5, 0~10V DC
  (Multi input, programmable range: Refer to Table of Measuring Range Codes.)

- Input impedance: 500kΩ min.

- Current: 4~20, 0~20mA DC
  (Multi input, programmable range: Refer to Table of Measuring Range Codes.)

- Receiving impedance: 250Ω

- Sampling cycle: 0.25 sec.

- PV bias: -1999~1999 unit

- PV filter: 0~100 sec.

- Isolation: Insulated between input and output (not insulated between input and system, SV bias and CT input)

■ Control

- Control mode: Auto-tuning PID

- Proportional band (P):
  Off, 0.1~999.9% FS (Off setting: On-Off action)

- Integral time (I):
  1~6000 sec.

- Derivative time (D):
  0~3600 sec.

- Manual reset (MR):
  -50.0~50.0% (valid when I=Off.)

- On-Off hysteresis:
  1~999 unit

- Proportional cycle:
  1~120 sec.

- Control output characteristics:
  RA / DA selectable (set to RA when shipped)

- Higher and lower output limit:
  0.0~100.0% (lower limit < higher limit)

■ Control Output type / rating

- Contact output (Y1): 240V AC 2.5A / resistive load

- Current output (I1): 4~20mA DC / load resistance: 600Ω max.

- SSR drive voltage output (P1):
  15± 3V DC / load current: 20mA max.

- Voltage output (V1):
  0~10V DC / load current: 2mA max.

- Isolated between control output and system and input (not insulated between control output I, P, V and analog output)

■ Manual control

- Output setting range:
  0.0~100.0%

- Setting resolution: 0.1%

- Output resolution: 0.5%

- Auto/Manual switching:
  Balanceless and bumpless (within proportional band range)

■ Alarm Output

- Alarm method:
  Individual setting and individual output, higher and lower limit alarms

- Alarm type:
  Deviation value alarm or absolute value alarm is selectable.

- Alarm setting range:
  Deviation value:
  Higher limit: 0~5000 unit
  Lower limit: -1999~0 unit

- When alarm is set beyond higher or lower limit of measuring range, alarm is activated at a point 10% beyond higher or lower limit.

- Absolute value:
  Higher and lower limits: Within measuring range

- Alarm action:
  On-Off action

- Action hysteresis:
  1~999 unit (both higher and lower limits)

- Inhibit mode:
  Selectable (both higher and lower limits)

- Alarm output / rating:
  Contact 1a (common) / 240 V AC 1.5A (resistive load)
### Event Output
(Can not be selected when heater break alarm is selected.)
- **Number of event outputs:** 1 point
- **Event type:** Selectable from following 8 types
  1. Higher limit deviation value alarm without inhibit action
  2. Lower limit deviation value alarm without inhibit action
  3. Higher limit absolute value alarm without inhibit action
  4. Lower limit absolute value alarm without inhibit action
  5. Higher limit deviation value alarm with inhibit action
  6. Lower limit deviation value alarm with inhibit action
  7. Higher limit absolute value alarm with inhibit action
  8. Lower limit absolute value alarm with inhibit action
- **Setting range:**
  - Deviation value:
    - Higher limit: 0~5000 unit
    - Lower limit: -1999~0 unit
    - When alarm is set beyond higher or lower limit of measuring range, alarm is activated at a point 10% beyond higher or lower limit.
  - Absolute value:
    - Within measuring range of higher and lower limits
- **Event action:** On-Off action
- **Event action hysteresis:** 1~999 unit
- **Event output / rating:** Contact 1a / 240V AC 1.5A (resistive load)

### Heater break alarm
(Can not be selected when event output is selected.)
- **Alarm action:** Heater amperage detected by externally attached CT (CT provided)
  - Alarm output On upon detection of heater break while output is On.
  - Alarm output On upon detection of heater loop alarm while output is Off.
- **Current setting range:** Off, 0.1~50.0A (Alarm action stops when Off is set.)
- **Setting resolution:** 0.1A
- **Amperage display:** 0.0~55.0A
- **Display accuracy:** 3% FS (when sine wave is 50 Hz)
- **Minimum time for action confirmation:** On time: 250 msec. minimum
- **Alarm output / rating:** Contact 1a / 240V AC 1.5A (resistive load)
- **Alarm holding:** Selectable
- **Sampling cycle:** 0.5 sec.
- **Isolation:** Insulated between CT input and output (not insulated between CT input and system and other inputs)

### Set value Bias
- **Setting range:** -1999~5000 unit
- **Setting resolution:** Same as display resolution
- **Action input:** Non-voltage contact (bias in action when input is closed)
- **Isolation:** Insulated between the set value bias input and output (not insulated between set value bias input and system and other inputs)

### Safety and EMC requirements
- **Safety:** IEC1010-1, EN61010-1
- **EMC:** EMI (emission) EN50081-1
  - EMS (immunity) EN50082-2

### Others
- **Data storage:** By non-volatile memory (EEPROM)
- **Operating ambient temperature/humidity range:** -10~50˚C / 90% RH max. (no dew condensation)
- **Supply voltage:** 100~240V AC±10% (50 / 60 Hz), 24V AC±10% (50/60Hz) or 24V DC±10%
- **Power consumption:** Max. 10VA(AC),6W (DC)
- **Insulation resistance:** Between input / output terminal and power supply terminal: 500V DC 20 MΩ minimum
  - Between input / output terminal and ground terminal: 500V DC 20 MΩ minimum
- **Dielectric strength:** 1 min. at 2300V AC between input / output terminal and power supply terminals
  - 1 min. at 1500V AC between power supply terminal and ground terminal
- **Protective structure:** Only front panel has simple dust-proof and drip-proof structure
- **Material:** PPO resin molding (equivalent to UL94V-1)
- **External dimensions:**
  - CN137: H72 × W72 × D110
    - (panel depth: 100) mm
  - CN134: H96 × W96 × D70
    - (panel depth: 60) mm
  - CN138: H96 × W48 × D110
    - (panel depth: 100) mm
- **Mounting:** Push-in panel (one-touch mount)
- **Panel thickness:** 1.0~3.5 mm
- **Panel cutout:**
  - CN137: H68 × W68mm
  - CN134: H92 × W92mm
  - CN138: H92 × W45mm
- **Weight:**
  - CN137: Approx. 290g
  - CN134: Approx. 310g
  - CN138: Approx. 280g

### Analog output
- **Number of analog outputs:** 1 point
- **Analog output type:** Selectable between process value (PV) and set value (SV)
- **Analog output:** 0~10mV DC, Output resistance: 10Ω
  - 0~10V DC, Load current: 2mA max.
  - 4~20mA DC, Load resistance: 300Ωmax.
- **Output accuracy:** ±1.5% (of displayed value)
- **Output resolution:** Approx. 0.0125% (1/8000)
- **Output updating cycle:** 0.25 sec.
- **Output scaling:** Within measuring range
- **Isolation:** Insulated between analog output and system and input (not insulated between analog output and control output I, P, V)
3. Installation and Wiring

4-1. Installation Site

**CAUTION**

When selecting a site for the controller, avoid the places mentioned below. Selection of these places may result in a malfunction or damage to the controller, including the worse case of fire, depending on the circumstances.

1. Where flammable gas, corrosive gas, oil mist and particles that can deteriorate electrical insulation are generated or are abundant.
2. Where the temperature is below -10°C or above 50°C.
3. Where the relative humidity is 90% RH or below dew point.
4. Where highly intense vibration or impact is generated or transferred.
5. Near high voltage power lines or where inductive interference can affect the operation of the product.
6. Dew drops or direct exposure to sun light.
7. Where the elevation is in excess of 2,000 m.

4-2. Mounting

1. Cut a hole for mounting the controller in the panel with reference to the cutout drawing shown in section 4-4 on page 3.
2. The panel thickness should be 1.0~3.5 mm.
3. As the instrument is provided with pawls for fixing, mount it by pressing it firmly from the front of the panel.

4-3. How to Take the Controller out of the Case

Under ordinary circumstances, the controller need not be taken out of its housing. However, if such a step is necessary for the purpose of replacement or the like, follow the procedure described below.

Insert a screwdriver with a tip width of 6 to 9 mm into a notch (where the packing is exposed) on the bottom of the casing and rotate the screw driver while pressing up the lock lever behind the packing. When the controller body comes out of the housing by a few mm, use your hand to pull it out completely.

4-4. External Dimensions and Panel Cutout

Please refer to section 4-4 on page 3.
4-5. Wiring

**WARNING**

- When wiring, make sure to disconnect the power supply. Otherwise an electric shock may result.
- Make sure the protective conductor terminal (①) is grounded. Otherwise an electric shock may result.
- Do not touch terminals or other charged elements with power supplied after wiring.

1. Follow the terminal layout shown in section 4-6 and make sure to carry out the correct wiring.
2. Press-fit terminal must fit an M3.5 screw and have a width of 7 mm or smaller.
3. In the case of the thermocouple input, use a compensating conductor compatible with the type of thermocouple selected.
4. In the case of R.T.D. input, the resistance of a single lead wire must be 5Ω or less and the three wires must have the same resistance value.
5. The input signal wire must not be accommodated with a high-voltage power cable in the same wiring conduit or duct.
6. Shielded wire (one-point grounding) is effective to avoid electrostatic induction noise.
7. An effective way to avoid magnetic induction noise is to twist the input wires at short and equal intervals.
8. The wiring for power supply must be a 600V vinyl insulated wire or cable having a cross-sectional area of 1 mm² or larger or a wire or cable of the same or better performance.
9. The wire for grounding must be larger than 2 mm² and must be grounded at a grounding resistance of 100Ω or lower.
10. Noise filter

   If the instrument appears to have noise interference caused by the power supply, use a noise filter to prevent erroneous functioning.

   Install a noise filter on the grounded panel and make the wire connecting the noise filter OUT terminal and the power supply terminal on the controller as short as possible.

4-6. Terminal Layout

5. Names and Functions of Parts

![Diagram of Names and Functions of Parts]
### Display Section

1. **Process value (PV) display / red**
   - Process values (PV) are displayed. When a parameter is set, its type is displayed.
   - When something goes out of order in the system, an error message is displayed.

2. **Set set value (SV) display / green**
   - Set set value are displayed. When a parameter is set, its value is displayed.

3. **Event / HB lamp (EV/HB) / red**
   - The lamp lights when event output is on or heater break / heater loop alarm output is on.

4. **Lower limit alarm lamp (AL) / red**
   - The lamp lights when lower limit alarm output is on.

5. **Higher limit alarm lamp (AH) / red**
   - The lamp lights when higher limit alarm output is on.

6. **Output lamp (OUT) / green**
   - The lamp lights when control output is on and its brightness changes in proportion to the amount of output in the case of current output and voltage output.

7. **Auto tuning lamp (AT) / green**
   - The lamp lights while auto tuning is in progress and remains lit while standing by for AT action.

8. **Manual control lamp (MAN) / red**
   - The lamp flashes while in the manual control mode.

9. **Set value bias lamp (SB) / green**
   - The lamp lights while the set value bias action is in progress.

### Setting Section

**Display key**
- When this key is pressed in any of the parameter screens, the display returns to the display / set value screen.
- Pressing it for 5 seconds brings the initial value setting screen (mode 2) on display.

**Auto tuning key**
- This key is used to execute and stop auto tuning action.

**Parameter key**
- This key is used to select a parameter to be set or changed. Press it for 3 seconds to move to the parameter block in mode 1.

**Up key**
- The flashing of the decimal point in the lowest place on the SV display shows that the value is ready to be changed. Press this key to increase a numeric data or to change selected character data.

**Enter key**
- This key is used to register a changed data (the decimal point in the lowest place flashes.) Once registered, the decimal point stops flashing. If this key is pressed for 3 seconds on the output screen (0-1), the mode changes to manual control.

**Down key**
- The flashing of the decimal point on the lowest place on the SV display shows that the value is ready to be changed. Press this key to decrease a numeric data or to change selected character data.

### 6. Parameter Operating Procedure, Flow, and Functions

6-1. Operating Procedure

(1) Turn on the power supply to display the "Mode 0-0" basic screen.

(2) The "Mode 0-0" basic screen displays the process value (PV) and the set value (SV) which are the starting points of the respective parameters.

(3) In order to move to the "Mode 1" screen group, press the **DISP** key for 3 seconds or longer on the "Mode 0-0" basic screen.

(4) In order to move to the "Mode 2" function selection mode screen group, press the **DISP** key for 5 seconds or longer on the "Mode 0-0" basic screen.

(5) In order to move from one screen to another within each screen group, press the **ENT** (parameter) key.

(6) If you select a desired screen No. to be called within the "Mode 1" group on the first screen (Mode 1-0) in the "Mode 1" screen group, you can move directly to that screen (direct call).

(7) Use the **A** & **V** keys to set the value on each screen (the decimal point in the lowest place keeps flashing during the value setting procedure) and press the **ENT** key to register the value.

(8) The "Mode 0-0" basic screen can be accessed from any screen by pressing the **DISP** key.

**"Mode 0" Operation Parameter Screen Group (Setting of the set value, alarm/event action point, Sb, P, I, D)**

- This group is subject to the most frequent setting modification.
- Press the **ENT** key to move to "Mode 0-1" from the "Mode 0-0" basic screen.
- Press the **DISP** key to move to the next screen within the screen group.
- Use the **A** & **V** keys to set the value on each screen (the decimal point in the lowest place keeps flashing during the value setting procedure) and press the **ENT** key to register the value.

**"Mode 1" Operation Parameter Screen Group (Setting the value for each function)**

- This group is not often subject to frequent setting modification.
- Press the **DISP** key for 3 seconds or longer to move to "Mode 1-0" from the "Mode 0-0" basic screen.
- Press the **DISP** (parameter) key to move from one screen to another within the screen group.
- Use the **A** & **V** keys to set the value on each screen (the decimal point in the lowest place keeps flashing during the value setting procedure) and press the **ENT** key to register the value.

**"Mode 2" Function Selection Screen Group**

- This group is used to select functions.
- Press the **ENT** key for 5 seconds or longer to move to "Mode 2-1" from the "Mode 0-0" basic screen.

For the operating procedure on each screen, refer to section 7 "Operation" on page 19.

<td>0.1–100.0% (100%) o_H&lt;o_L</td>
<td>* The lower limit may be used to secure the minimum temperature and the higher limit. The upper limit can be used for the prevention of overshooting.</td>
</tr>
<tr>
<td>Process value bias setting 1-11</td>
<td>-999–1999 Unit (0 Unit)</td>
<td>If a temperature gap is observed due to the temperature within the furnace to be controlled and the position of the detector, setting the gap (process value bias) allows display and execution of control with the &quot;process value (PV) + process value bias (PV_b)&quot; as the measured input value.</td>
</tr>
<tr>
<td>Process value filter setting 1-12</td>
<td>0–100 sec. (0 sec.)</td>
<td>When the process value input contains noise, the display of the process value and the result of the control operation may be affected. In order to minimize such influence, a time constant is set.</td>
</tr>
<tr>
<td>Lower limit side set value limiter setting 1-13</td>
<td>Within measuring range (Lower limit value of measuring range) SV_L&lt;SV_H</td>
<td>Setting the limit values of the set value range in advance will result in the values being limited within the set limit range.</td>
</tr>
<tr>
<td>Higher limit side set value limiter setting 1-14</td>
<td>Within measuring range (Higher limit value of measuring range) SV_H&lt;SV_L</td>
<td>When executing AT action, if you want to avoid hunting due to a limit cycling at a set set value, set a hypothetical SV so as to execute AT action at a point apart from the actual set value.</td>
</tr>
<tr>
<td>AT execution point setting 1-15</td>
<td>0–5000 Unit (0 Unit)</td>
<td>When executing AT action, if you want to avoid hunting due to a limit cycling at a set set value, set a hypothetical SV so as to execute AT action at a point apart from the actual set value.</td>
</tr>
<tr>
<td>Set value point setting (not displayed when POFF, 1.OFF.) 1-16</td>
<td>oFF, 0.01–1.00 (0.40)</td>
<td>This function is used to adjust overshooting or undershothing at a set value by using the control result as a guideline in PID control mode. The control of overshothing is the most effective when SF is at 1.00.</td>
</tr>
<tr>
<td>Initial reset setting 1-17</td>
<td>0.01–0.50.0% (0.0%)</td>
<td>This function locks the key operation. It can be used to prevent erroneous key operation after completing the setting of various data.</td>
</tr>
</tbody>
</table>

* The larger the time constant is, the greater the effect of removing noise.
7. Operation

7-1. Power ON and Initial Screen Display

When power is supplied, a selected function is displayed on the screen as shown below. Then, in about 3 seconds, the “Mode 0-0” basic screen is displayed.

This controller series is designed for multi-range or programmable range operation. The controller is set as follows at our plant before shipping.

Values set before shipping:

<table>
<thead>
<tr>
<th>Input</th>
<th>Standard / Rating</th>
<th>Measuring Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Thermocouple</td>
<td>JIS K</td>
<td>0 ~ 800 °C</td>
</tr>
<tr>
<td>2. R.T.D.</td>
<td>JIS Pt100</td>
<td>0.0 ~ 200.0 °C</td>
</tr>
<tr>
<td>3. Voltage (mV)</td>
<td>0-10mV DC</td>
<td>0.0 ~ 100.0 No-legend</td>
</tr>
<tr>
<td>4. Current (mA)</td>
<td>4-20mA DC</td>
<td>0.0 ~ 100.0 No-legend</td>
</tr>
<tr>
<td>5. Voltage (V)</td>
<td>1-5V DC</td>
<td>0.0 ~ 100.0 No-legend</td>
</tr>
</tbody>
</table>

7-2. Function Selection Screen “Mode 2-1”

“Mode 2-1” is the screen used to select such functions as measuring range, control action (RA/DA) and other optional functions, including alarms, events, heater break alarm (HB), and analog output.

Press the \( \text{DISP} \) key for 5 seconds in the “Mode 0-0” screen to call up the “Mode 2-1” screen. The decimal point shown in \( \text{②} \) flashes to show that number is ready to be changed.

If you want to change it, select a measuring range code (see the attached table) using the \( \text{③} \) & \( \text{④} \) keys and register it using the \( \text{②} \) key. When there is no need to change it, press the \( \text{③} \) key.

The decimal point in \( \text{①} \) begins flashing to show that the control action mode (RA/DA) is ready to be selected.

In this way, press the \( \text{①} \) key to move the flashing decimal point to the desired position and change the other set conditions by pressing the \( \text{③} \) & \( \text{④} \) keys and register it by pressing the \( \text{②} \) key.

Every time the \( \text{②} \) key is pressed, the flashing decimal point showing readiness to be changed moves to the following item in the sequence of \( \text{①} \), \( \text{②} \) through \( \text{③} \) and \( \text{④} \) finally to \( \text{⑤} \). When you have finished changing, press the \( \text{DISP} \) key to move to the “Mode 0-0” basic screen.

---

In case measuring range is modified, set values, alarm action point and other related values are all initialized.
Either of the control output action characteristics, DA (direct action) or RA (reverse action), is set. DA (direct action) means that the lower the control output falls, the more the process value (PV) drops below the set value (SV). RA (reverse action) means that the more the process value (PV) drops below the set value (SV), the higher the control output rises. RA is used for heating control.

- **Indication No. 7**: Selection of Output Action Characteristics (selection between RA / DA)

- **Indication No. 8**: Selection of Analog Output Type (P/S)

- **Indication No. 9**: Selection of Types of Alarms (Optional)

- **Indication No. 10**: Selection of Types of Events (Optional)

- **Indication No. 11**: Selection of Heater Break Alarm (HB) (Optional)

7-3. Measuring Range Scaling “Mode 2-2” (For voltage or current input)

Measuring range scaling function allows a setting within the following range.

- **Scaling range**: -1999~9999 counts
- **Span**: 100~5000 counts

Initial values:
- Lower limit value: 0.0
- Higher limit value: 100.0

**“Mode 2-2” Call for scaling setting screen**

Press the DISP key for 5 seconds or longer in the “Mode 0-0” basic screen to move to the “Mode 2-1” screen. Next, press the ENT key to call up the “Mode 2-2” scaling screen. Then, the decimal point in the lowest place in the PV section starts flashing to indicate that particular setting of the scaling is possible.

**Lower limit setting**

PV display

Use the or keys to set the lower limit and press the KEY to register it. If the value is registered, the flashing of the decimal point in the PV section goes out and the decimal point in the lowest place in the SV section starts flashing. Then, move to the “Higher limit setting” screen.

**Higher limit setting**

SV display

Use the or keys to set the higher limit and press the KEY to register it. If the value is registered, the decimal point in the lowest place in the PV and SV sections starts flashing. Then, move to the “Decimal point position setting” screen.

**Decimal point position setting**

Use the or keys to set the decimal point position and press the KEY to register it. Then, move to the “Mode 2-2” first screen. Press the DISP key to move back to the “Mode 0-0” basic screen.
7-4. Setting of set value “Mode 0-0”

(1) After supplying power, confirm that the “Mode 0-0” basic screen is displayed.

(2) Use the \[ \text{A} \] & \[ \text{G} \] keys to set the set value while checking the SV display. Then, the decimal point in the lowest place in the SV display starts flashing.

(3) Press the \[ \text{ENT} \] key to register the set value. Then, the flashing of the decimal point goes out and the setting of the set value is completed.

7-5. Setting of alarm action point “Mode 0-2/0-3” (Optional)

(1) Press the \[ \text{G} \] key twice in the basic screen to display the higher limit alarm (H) parameter or three times to display the lower limit alarm (L) parameter.

(2) Use the \[ \text{A} \] & \[ \text{G} \] keys to set the alarm action point value while checking the SV display. Then, the decimal point in the lowest place in the SV display starts flashing.

(3) Press the \[ \text{ENT} \] key to register the alarm action point value. Then, the flashing of the decimal point goes out.

(4) Press the \[ \text{DISP} \] key to go back to the basic screen.

7-6. Execution of Auto Tuning (AT) Action

Auto tuning functions to automatically measure, compute, and set optimum constants in PID control. Auto tuning can be executed in any of the following states: immediately upon supplying power, while temperature is rising, and during stable control.

**Execution of Auto Tuning (Upon Activation)**

<table>
<thead>
<tr>
<th>PV</th>
<th>Set value (SV)</th>
<th>AT action (SV)</th>
<th>AT lamp goes out.</th>
<th>AT lamp flashes.</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Up</td>
<td>AT action</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Operating procedure
  
  (1) Press the \[ \text{AT} \] key in the basic screen during operation to establish auto tuning standby condition. Then, the AT lamp lights up.
  
  (2) Press the \[ \text{AT} \] key to execute AT action. Then the AT lamp goes out indicating that the AT action is being executed.
  
  (3) When the AT action is completed, the control action with new PID constants starts. Then the AT Lamp goes out.

**To Stop Auto Tuning in the Execution**

Press the \[ \text{AT} \] key and then the \[ \text{ENT} \] key. The AT lamp goes out and auto tuning action is released. In this case, PID values return to those before the start of auto tuning.

**Auto tuning cannot be done in the following cases:**

- While manual control is on
- When the input value is out of the measuring range
- When the proportional band is set at P=Off (On-Off control)
- If the \[ \text{AT} \] key is not pressed within 5 seconds during standby (AT lamp flashing) for AT
- When the H side output limiter differs from the L side one by 20% or less

**Restrictions on Execution of Auto Tuning**

- If the process value gets overscale, AT is forced to end.
- While auto tuning is on, no settings can be changed except the alarm or event setting.
- While auto tuning is on, manual control cannot be turned on.
- While auto tuning is on, the set value bias (SB) is maintained at the value before the start of auto tuning. A change of SB input becomes valid only when the auto tuning action ends.
- If the auto tuning action exceeds 200 minutes, it is forced to stop and PID values before the start of AT are used.
7-7. Operation by Manual Control “Mode 0-1”

Changing to manual control mode

Changing to control output manual mode and setting of manual control output value is operated in the control output value display (Mode 0-1). In addition, operation to return to the auto mode from the manual mode is done in the mode 0-1 screen.

(1) Press the key in the basic screen (0-0) to call up the mode 0-1 screen. Then, the control output value is displayed in the SV display.

(2) Next, press the key for 3 seconds to start the flashing of the manual control action indicator lamp (MAN lamp) and control output manual mode is established. Use the & keys to change the output value setting. After that, the changed value is displayed.

(3) Even in the manual mode, you can move to another screen (or screen group) by pressing the key and/or the key. Note that the control output is set to be activated manually at this moment. (The manual mode is selected if the MAN lamp is flashing.)

(4) In order to release the control output manual mode (when the MAN lamp is flashing), press the key for 3 seconds in the mode 0-1 screen. Then, the MAN lamp goes out and the mode changes to control output auto mode.

Restrictions on Manual Control

- The manual control action and output value remain stored even when power is turned off and then on again.
- When the measuring range is changed, the manual control mode is released and the automatic control mode returns.
- When switching from the auto to the manual mode, the action becomes balanceless and bumpless. This does not happen, however, if the process value (PV) is out of the proportional band at the time of mode switching.
- The selectable range of control output in the manual control mode is within the limit range of output limiters. (During On-Off action at P=ff, 0.0% and 100.0% though 100.0% represents 0.0% in the monitor screen.)

7-8. Setting of Set Value Bias (Sb) “Mode 0-5” (Optional)

If a bias amount is previously set in the set set value, the initial set set value added with the bias amount makes a set value when the SB terminals go on (short circuited).

\[
SB \text{ terminals (On)} = Set \text{ set value (SV)} + \text{bias value (Sb)}
\]

\[
SB \text{ terminals (Off)} = Set \text{ set value (SV)}
\]

7-9. Setting of Current Values for Heater Break and Heater Loop Alarms (Optional)

The heater break alarm and heater loop alarm can be used when the control output is contact (Y) or SSR drive voltage output (P).

- **Alarm Set Value**
  - Set the heater break alarm at about 85% of the value of input from the current transformer (CT) or lower when the power supply fluctuates significantly.
  - If more than one heater is connected in parallel, a slightly larger value should be set so that an alarm can be output even if only one of them breaks down.

- **Current transformer (CT)**
  - Current transformers (CT) for 30A and 50A are available.
  - **How to connect current transformer (CT)**
    - Insert a load line through the hole specially prepared for the CT. There is no polarity with the wiring from the CT to the controller.
    - A heater break alarm is output when the CT detects the heater current while the control output is on. The alarm is activated by the abnormality of the detected current value being lower than the set current value.
    - A heater loop alarm is output when the CT detects the heater current while the control output is off. The alarm is activated by the loop abnormality of the output circuit when the detected current value is higher than the set current value.
Selection of heater break alarm output mode

You can select Lock mode or Real mode for the alarm output mode. The mode can be selected in the function selection screen "Mode 2-1" (see page 19).

7-10. Operation of Keylock (Mode 1-18)

This function inhibits the changing of various parameters and set value, the setting of auto tuning, manual control, etc., and a mode change by front key operation. The function can be used to prevent erroneous operation after the completion of setting.

Select keylock mode by key. Select the mode using the and keys for setting and the key for registration. To release Keylock, select the same mode and set OFF. Then press the key.

<table>
<thead>
<tr>
<th>Type of Keylock</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oFF</td>
<td>All locks released</td>
</tr>
<tr>
<td>1</td>
<td>Only SV, AT &amp; MAN can be changed.</td>
</tr>
<tr>
<td>2</td>
<td>Only SV can be changed.</td>
</tr>
<tr>
<td>3</td>

WARRANTY/DISCLAIMER

OMEGA ENGINEERING, INC. warrants this unit to be free of defects in materials and workmanship for a period of 13 months from date of purchase. OMEGA Warranty adds an additional one (1) month grace period to the normal one (1) year product warranty to cover handling and shipping time. This ensures that OMEGA's customers receive maximum coverage on each product.

If the unit should malfunction, it must be returned to the factory for evaluation. OMEGA's Customer Service Department will issue an Authorized Return (AR) number immediately upon phone or written request. Upon examination by OMEGA, if the unit is found to be defective it will be repaired or replaced at no charge. OMEGA's WARRANTY does not apply to defects resulting from any action of the purchaser, including but not limited to mishandling, improper interfacing, operation outside of design limits, improper repair, or unauthorized modification. This WARRANTY is VOID if the unit shows evidence of having been tampered with or shows evidence of being damaged as a result of excessive corrosion; or current, heat, moisture or vibration; improper specification; misapplication; misuse or other operating conditions outside of OMEGA's control. Components which wear are not warranted, including but not limited to contact points, fuses, and triacs.

OMEGA is pleased to offer suggestions on the use of its various products. However, OMEGA neither assumes responsibility for any omissions or errors nor assumes liability for any damages that result from the use of its products in accordance with information provided by OMEGA, either verbal or written. OMEGA warrants only that the parts manufactured by it will be as specified and free of defects. OMEGA MAKES NO OTHER WARRANTIES OR REPRESENTATIONS OF ANY KIND WHATSOEVER, EXPRESSED OR IMPLIED, EXCEPT THAT OF TITLE, AND ALL IMPLIED WARRANTIES INCLUDING ANY WARRANTY OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE HEREBY DISCLAIMED. LIMITATION OF LIABILITY: The remedies of purchaser set forth herein are exclusive and the total liability of OMEGA with respect to this order, whether based on contract, warranty, negligence, indemnification, strict liability or otherwise, shall not exceed the purchase price of the component upon which liability is based. In no event shall OMEGA be liable for consequential, incidental or special damages.

CONDITIONS: Equipment sold by OMEGA is not intended to be used, nor shall it be used: (1) as a "Basic Component" under 10 CFR 21 (NRC), used in or with any nuclear installation or activity; or (2) in medical applications or used on humans. Should any Product(s) be used in or with any nuclear installation or activity, medical application, used on humans, or misused in any way, OMEGA assumes no responsibility as set forth in our basic WARRANTY/DISCLAIMER language, and additionally, purchaser will indemnify OMEGA and hold OMEGA harmless from any liability or damage whatsoever arising out of the use of the Product(s) in such manner.

RETURN REQUESTS / INQUIRIES

Direct all warranty and repair requests/inquiries to the OMEGA Customer Service Department. BEFORE RETURNING ANY PRODUCT(S) TO OMEGA, PURCHASER MUST OBTAIN AN AUTHORIZED RETURN (AR) NUMBER FROM OMEGA'S CUSTOMER SERVICE DEPARTMENT (IN ORDER TO AVOID PROCESSING DELAYS). The assigned AR number should then be marked on the outside of the return package and on any correspondence.

The purchaser is responsible for shipping charges, freight, insurance and proper packaging to prevent breakage in transit.

FOR WARRANTY RETURNS, please have the following information available BEFORE contacting OMEGA:
1. P.O. number under which the product was PURCHASED,
2. Model and serial number of the product under warranty, and
3. Repair instructions and/or specific problems relative to the product.

OMEGA's policy is to make running changes, not model changes, whenever an improvement is possible. This affords our customers the latest in technology and engineering.
