## NOTES, WARNINGS and CAUTIONS

Information that is especially important to note is identified by following labels:

- NOTE
- WARNING or CAUTION
- IMPORTANT
- TIP
$\triangle$

NOTE: Provides you with information that is important to successfully setup and use the Programmable Digital Meter.

CAUTION or WARNING: Tells you about the risk of electrical shock.

CAUTION, WARNING or IMPORTANT: Tells you of circumstances or practices that can effect the instrument's functionality and must refer to accompanying documents.

TIP: Provides you helpful hints.

## PART 1 <br> BEFORE YOU BEGIN

## Customer Service

If you need assistance, please call the nearest Customer Service Department, listed in this manual.

## Manuals, Software

The latest Operation and Communication Manual as well as free configuration software and Active controls are available from the website listed in this manual or on the CD-ROM enclosed with your shipment.

## Communication Menu

The Communication menu only appears with devices purchased with the RS-232C / RS-485 Serial Communications Option. Purchasing the controller with Serial Communications permits a controller to be connected directly to the PC's available COM port. Device can be configured or monitored from an IBM PC compatible computer using software available on our CD or on our website.

## To Disable Outputs

Standby Mode is useful during setup of the controller or when maintenance of the system is necessary. When the controller is in standby, it remains in the ready condition but all outputs are disabled. This allows the system to remain powered and ready to go.

1. When the controller is in "RUN" Mode, push © twice to disable all outputs and alarms. It is now in "STANDBY" Mode.
2. Push © once more to resume "RUN" Mode.

Tip
PUSH © TWICE to disable the system during an EMERGENCY.

## To Reset the Meter

1. When the controller is in the "MENU" Mode, push $\boldsymbol{O}$ down button once to direct controller one step backward of the top menu item.
2. Push © twice to reset controller, prior to resuming "Run" Mode except after "Setpoints" and "Alarms" that will go to the "Run" Mode without resetting the controller.

## PART 2 <br> INTRODUCTION TO DIGITAL COMMUNICATION

### 2.1 Overview

This manual describes how to use a digital communication link and i-SERIES or MODBUS communication protocols to operate the iLD Big Display controllers. It has been assumed that the user has some experience with communication protocols and some familiarity with iLD Big Display controllers.

### 2.2 Definitions of terms

This guide is intended to help the user to become familiar with digital communication between a computer (or other controlling instrument) and one or more devices. User of this manual should be familiar with following definitions:

- Serial Communication is the exchange of the data one bit at a time on a single data line. Serial compares with parallel communication, which sends several bits of information simultaneously over multiple lines or channels.
- Interface are connections over which computers communicate. They may use one pair of wires to send information in one direction and another pair to send in the opposite direction (full duplex). They may also use one pair to send the information in both directions (half duplex).
- Bit is a unit of digital data (binary digit) either a " 1 " or " 0 ".
- Byte is a string of seven or eight bits, which represents a single character.
- ASCII (American Standard Code for Information Interchange) - is a 7 -bit code defines 128 characters, which include digits, upper and lowercase letters, punctuation symbols, and control codes such as backspace, line feed, carriage return and so on. The ASCII code can be written in a base - 16 number system, called hexadecimal ("hex"). The first 10 digits of this system are represented by the numbers 0 through 9 , and the other six digits are represented by the letters A through F. The 128 ASCII character code with the decimal, hexadecimal and binary equivalents is listed in Appendix $B$.

## - Synchronous and Asynchronous Communications

There are two basic types of serial communications, synchronous and asynchronous. With synchronous communications, the two devices initially synchronize themselves to each other, and then continually send characters to stay in sync. Asynchronous means "no synchronization", and thus does not require sending and receiving idle characters. However, the beginning and end of each byte of data must be identified by start and stop bits. The serial ports on IBM-style PCs are asynchronous devices and therefore only support asynchronous serial communications.

## - Start and Stop Bits

The start and stop bits identify the beginning and end of each character and permit a receiver to resynchronize a local clock to each new character. The start bit indicates when the data byte is about to begin and the stop bit signals when it ends. The start bit is always a 0 . The stop bit is always a 1 .

## - Parity Bit

Besides the synchronization provided by the use of start and stop bits, an additional bit called a parity bit may optionally be transmitted along with the data. A parity bit affords a small amount of error checking, to help detect data corruption that might occur during transmission. You can choose either even parity, odd parity or no parity at all. When even or odd parity is being used, the number of marks (logical 1 bits) in each data byte are counted, and a single bit is transmitted following the data bits to indicate whether the number of 1 bits just sent is even or odd.

For example, when even parity is chosen, the parity bit is transmitted with a value of 0 if the number of preceding marks ( 1 's) is an even number. For the binary value of 01100011 the even parity bit would be 0 . If even parity were in effect when the binary number 11010110 is sent, then the parity bit would be 1 . Odd parity is just the opposite, and the parity bit is 0 when the number of mark bits ( 1 's) in the preceding word is an odd number. Parity error checking is very rudimentary. While it will tell you if there is a single bit error in the character, it doesn't show which bit was received in error. Also, if an even number of bits are in error then the parity bit would not reflect any error at all. No parity ignores the parity bit. When transmitted, each character is preceded by a start bit and followed by a stop bit plus an optional parity bit, making train of 10 or 11 bits for each transmitted character. The Figure 2.1 below shows transmission of the 7 bits of the ASCII lower case "c" with start, stop and even parity bits.

## - Baud Rate

The baud rate refers to the data transmission. It specifies the communication rate over the bus. When a change in signal represents one data bit, baud rate is equal to bits per second (bps). Standard baud rates for computers are 300, 600, 1200,2400, 4800, 9600 and 19200 baud.

## 7 - BIT CHARACTER

Figure 2.1 Transmission of " $c$ " with start, stop, and even parity bits.

## - Communication Protocol

A data communication protocol defines the rules and structure of messages used by all devices on a network for data exchange. This protocol also defines the orderly exchange of messages, and the detection of errors. iLD Big Display controllers use i-SERIES and MODBUS communication protocols.

## PART 3

## HARDWARE

### 3.1 Communication Interfaces

Two communication interfaces are supported in the iLD Big Display devices: RS-232 and RS-485. These standards define the electrical characteristics of a communication network.

- The RS-232 standard (point-to-point) allows a single device to be connected to a PC. The iLD Big Display devices operate with full-duplex RS-232 using three wires: a Rx receive wire, a Tx - transmit wire and a common ground wire. RS-232 cable length is limited to 50 feet.
- The RS-485 standard (multipoint) allows one or more devices to be connected (multi-dropped) using a two wire connection (half-duplex) $+\mathrm{Rx} /+\mathrm{Tx}$ and $-\mathrm{Rx} /-\mathrm{Tx}$. Use of RS-485 communications allows up to 32 "remote" devices to connect to the "master" computer with cable length up to 4000 feet long.
- Both interfaces use standard RS-232/RS-485 voltage levels.

Although the RS-485 is commonly referred to as a "two wire" connection, the iLD Big Display also provides a ground / return shield connection to use as a common connection for EMI noise protection.

The Table 3.1 shows the differences between RS-232 and RS-485 communication interfaces.

Table 3.1 Communication Interfaces

| Data Transmission Characteristics | RS232 | RS485 |
| :--- | :--- | :--- |
| Transmission Mode | Single ended | Differential |
| Electrical connections | 3 wire | 2 wire |
| Drivers per line | 1 driver | 32 drivers |
| Receivers per line | 1 receiver | 32 receiver |
| Maximum data rate | 20 k bits/s | 10 M bits/s |
| Maximum cable length | 50 ft (15 meters) | $4000 \mathrm{ft}(1200$ meters) |

## Note <br> Changing between RS-232 and RS-485 is possible through the front panel

 buttons (see Part 4 for details).
### 3.2 Wiring RS-232 Interface

Most PC's provide an RS-232 port for digital communication. The RS-232 communication uses three wire full-duplex system: a line for receiving data, a line for transmitting data and a common line between the computer and device. Usually PCs use a 25 or 9 pin connector.

Caution: Do not connect power to your instrument until you have completed all serial interface connections. Failure to do so may result in injury.

Figures 3.1 and 3.2 show the three-wire RS-232 connections between the host computer using a $9-$ pin or $25-$ pin " $D$ " connector and the iLD Big Display device.

Figure 3.1 Wiring between DB9 computer connector and RS-232 controller interface

Figure 3.2 Wiring between DB25 computer connector and RS-232 controller interface

Table 3.2 shows the pin connection assignments between the RS- 232 connector on the meter and the $9-$ pin or 25 -pin "D" connectors of your computer.

Table 3.2 Wiring RS-232 Interface

| COMPUTER |  |  | iLD Big DisplayFUNCTION/LABEL TB4 |
| :---: | :---: | :---: | :---: |
| PIN FUNCTION | DB9 | DB25 |  |
| Receive (Rx) | 2 | 3 | Transmit (Tx) 3 |
| Transmit (Tx) | 3 | 2 | Receive ( Rx ) 2 |
| Common ground | 5 | 7 | RTN 1 |

### 3.3 Wiring RS-485 Interface

RS-485 interface uses a two wire communication system (one for transmitting and one for receiving) plus a common wire to connect to the shield of a cable. It is recommended to use a shielded cable with one twisted pair.

Noters Use of twisted pair and shield will significantly improve noise immunity.

Figure 3.3 shows multipoint, half-duplex RS-485 interface connections for the iLD Big Display.

Figure 3.3 Multipoint, Half-Duplex RS-485 wiring

Value of the termination resistor is not critical and depends on the cable impedance.

Table 3.3 shows RS-485 half-duplex hookup using a computer's RS-232 interface, an RS-485 interface converter, and an iLD Big Display controller.

Table 3.3 RS-485 Half-Duplex Hook-up

[^0]PART 4 COMMUNICATION SETUP

### 4.1 Flow Chart

Figure 4.1 Flow Chart for Communication Option

### 4.2 Setup the iLD Big Display Device Through the Front Panel

You can setup your device by pressing the push buttons on the front panel.

## ENTER COMMUNICATION OPTION MENU:

Press © 1) Press © until [WFG prompt appears.
Press © 2) Display advances to INPH Input Menu.
Press © 3) Press ©, until display advances to [DAF Communication Options Menu.
Press (0) 4) Display advances to [.PRR Communication Parameters Submenu.

- Use © to advance/navigate through all Communication Menu items.
© - Press © to access the submenus from a top level of Communication Menu item. Press © to store a submenu selection.
$\boldsymbol{0}$ - Press $\boldsymbol{\triangle}$ to scroll through "flashing" selection. When a numerical value is displayed, press $\mathbf{0}$ to change a value of this parameter.
$\boldsymbol{\top}$ - Press $\boldsymbol{\nabla}$ to go back to a top level of Communication Menu item. Press $\boldsymbol{O}$ twice to reset the device to Run mode.

### 4.3 Abbreviations, Range, Default Setup

The Communication Menu Displays items using some abbreviations and compact wording shown on Table 4.1.

Table 4.1 Abbreviations, Range, Default Setup

| Display <br> (abbreviations) | Function | Range/ Definition |  |
| :--- | :--- | :--- | :--- |
| C.PAR | Communication <br> Darameter: |  |  |
| bAUd | Baud rate | $300,600,1200,2400$ <br> $4800,9600,19200$ |  |
| PRtY (odd_, EVEN, <br> No | Parity | Odd, Even, No | 9600 |
| dAtA (7.bit, 8.bit) | Data bit | 7 bit, 8 bit | odd |
| StOP (1.bit, 2.bit) | Stop bit | 1 bit, 2 bit | 7.bit |
| bus.F | Bus format: | 1.bit |  |
| M.bUS | Modbus protocol | Yes - Modbus protocol enabled <br> No - i-Series protocol enabled | No |
| _LF_ | Line feed | Yes - print on every other line <br> No - print on every line | No |
| ECHO | Yes - echo the command <br> parameter <br> No - no echo | -YES |  |
| StNd (232C, 485_) | Communication <br> Standard | RS-232, RS-485 | 232C |
| ModE (CMd_, CoNt) | Data Flow Mode | Command - operate in Command <br> Mode (respond to valid command). <br> Continuous - operate in <br> Continuous mode (transmit <br> different measurement values <br> continuously on the bus). | CMd_ |

Abbreviations, Range, Default Setup Continued

| SEPR (SPCE, _cR_) | Data Separation Character | Space - space inserted after each piece of data. <br> Carriage Return - carriage return inserted after each piece of data | SPCE |
| :---: | :---: | :---: | :---: |
| dAt.F | Data Format: |  |  |
| stAt | Alarm Status | Yes - enables the transmission of Alarms Value No - disable | _No_ |
| RdNG | Reading | Yes - enables the transmission of Reading Value No - disable | _Yes |
| PEAk | Peak | Yes - enables the transmission of Peak Value No - disable | _No_ |
| VALY * | Valley | Yes - enables the transmission of Valley Value No - disable | No_ |
| GROS ** | Gross | Yes - enables the transmission of Gross Value No - disable | _No_ |
| UNit | Units | Yes - enables the transmission of Units of Measurement No - disable | _No_ |
| AddR | Multipoint Address | 0000 to 0199 - Addressed Meter | 0001 |
| tR.tM | Transmit Time Interval | 0000 to 5999 sec - transmission Time Interval between consecutive transmissions in Continuous Mode | 0016 |
|  | Recognition Character | 20 Hex to 7F Hex (32 to 127 Dec ) -see Table 2.1, except "^", "A", "E" | * |

*     - For Temperature/Process instrument only
** - For Process/Strain Gauge instrument only

## Note

1. There is no Continuous Mode, when the device is configured to use the RS-485 interface standard.
2. The Multipoint Address will be included in the transmission data if RS-485 standard has been selected in the menu items.
3. Transmit time is available only when the device has been configured for Continuous Mode and RS-232 Standard.
4. If the meter is in point-to-point Continuous Mode, it ignores any transmitted commands except Crtl S, which will stop transmission.

## Communications Parameters Submenu

Allows the user to adjust Serial Communications settings of the device. When connecting an instrument to a computer or other device, the Communication Parameters must match. Generally the default settings shown in Table 4.1 should be utilized.

## Bus Format Submenu

Determines communications standards and command/data formats for transferring information into and out of the device via the Serial Communications Bus.
Bus Format submenus essentially determine how and when data can be accessed via the Serial Communications Port of the device.

## Data Format Submenu

Preformatted data can be sent automatically or upon request from the device. Use the Data Format Submenus to determine what data will be sent in this preformatted data string. At least one of the Data Format suboptions must be enabled to send output data to the Serial Bus.

## Recognition Character

A selectable symbol transmitted as the first character of each message from the computer, which is used for message security: the meter ignores messages without this symbol.

## PART 5

## i-SERIES PROTOCOL

To Enable the i-Series Protocol, set the Modbus menu item to "No" in the Bus Format Submenu of the Communication Menu. Refer to Section 5.7.11.

A Data Communication Protocol defines the rules and structure of messages used by all devices on a network for data exchange. A typical transaction will consist of a request to send from the "master" followed by the response from the "slave".

### 5.1 Command Structure

The device can be commanded to "Read", i.e., to transmit (send) data from either the nonvolatile memory (EEPROM) or from the volatile working memory (RAM).

The device can also be commanded to "Write", i.e., store new values for data processing or control.

There are different command types associated in communicating with your meter shown in Table 5.1, which shows the Command Prefix Letters (Command Classes).

Table 5.1 Command Prefix Letters

| COMMAND PREFIX <br> (COMMAND CLASS) | MEANING |
| :--- | :--- |
| ^AE | Special read, Communication parameters |
| $\mathbf{P}$ (Put) | Write HEX data into RAM |
| W (Write) | irite HEX data into EEPROM. 1,000,000 writes to EEPROM |
| $\mathbf{G}$ (Get) | Read HEX data from RAM |
| $\mathbf{R}$ (Read) | Read HEX data from EEPROM |
| $\mathbf{U}$ | Read status byte |
| $\mathbf{V}$ | Read measurement data string in Decimal format |
| $\mathbf{X}$ | Read measurement data values in Decimal format |
| $\mathbf{D}$ | Disable |
| $\mathbf{E}$ | Enable |
| $\mathbf{Z}$ | Reset |

### 5.2 Command Formats

Table 5.2 shows the command formats for iLD Big Display devices.
Table 5.2 Command Formats

| For "P" and "W" Command classes: | For "G" and "R" Command classes: | For "X", "V", "U", "D", "E", and"Z" Command classes: |
| :---: | :---: | :---: |
| P | P | Point-to-point mode |
| int |  |  |
| * nnccc [ [<data>]<cr> | * nnccc <cr> | * nnccc <cr> |

## Where:

"*" is the selected Recognition Character. You may select any ASCII table symbol from "!" (HEX address " 21 ") to the right-hand brace (HEX "7D") except for the caret "^", "A", " $E$ ", which are reserved for bus format request.
"ccc" stands for the hex-ASCII Command Class letter (one of eleven given in Table 5.1), followed by the two hex-ASCII Command Suffix characters identifying the meter data, features or menu items to which the command is directed (given in Table 5.3).
"<data>" is the string of characters containing the variable information the computer is sending to the meter. These data (whether BCD or binary) are encoded into hex-ASCII characters, two characters to the byte. Square brackets (indicating optional status) enclose this string, since some commands contain no data.
"<nn>" are the two ASCII characters for the device Bus Address of RS-485 communication. Use values from "00" to hex "C7" (199 decimal).

Table 5.3 and 5.4 shows the command letters and suffix for iLD Big Display devices.
Table 5.3 Command Letters and Suffix for Temperature/Process and Process/Strain Gauge Instruments

| Command | Command <br> Index | Function | Command <br> Bytes | \# Of <br> Characters | Default <br> Value |

| V | 01 | SEND DATA STRING | 0 | 0 | - |
| Z | 02 | HARD RESET | 0 | 0 | - |
|  |  |  | 0 |  |  |

## Examples:

1. To reset the controller, send *Z02 (Table 5.3 \& 5.4)
2. To read Setpoint 1, send *R01 (Table 5.3 \& 5.4)
3. To change Setpoint 1 to 100.0, send *W012003E8 (see explanation below)

Description: SETPOINT.23~0 means 3 bytes x 8 bit positions
(2 hex. character in each byte)
Where $23 \sim 0$ are $3 \times 8=24$ Binary bit positions

SETPOINT. 23 =
$0=$ positive sign
1 = negative sign

SETPOINT.22~20 =
000 - Not Allowed
001 - Decimal Point 1 (FFFF.)
010 - Decimal Point 2 (FFF.F)
011 - Decimal Point 3*(FF.FF)
101 - Decimal Point 4*(F.FFF)
*Process only

SETPOINT.19~0 =
Setpoint data

For 100.0: Positive sign = 0, Decimal Point $2=010 \mathrm{Bin}$, Setpoint data $1000=3 \mathrm{E} 8 \mathrm{Hex}=$ =001111101000 Bin

$$
\text { The command data }=001000000000001111101000 \mathrm{Bin}=2003 \mathrm{E} 8 \mathrm{Hex} .
$$

Send *W01 20 03E8
where:
*W01 - *<ccc> - write to Setpoint 1 (Table 5.2)
2003E8 - <data> - Setpoint data in hexadecimal format including sign and decimal point (Table 5.2)

## Note ${ }^{\text {E }}$

No spaces are allowed in the data string. The spaces shown on the above example for illustration purposes only.

Noterse Decimal Point position for TC/RTD $=1$ or 2 , for PROCESS $=1,2,3$, or 4

Decimal Point position for Set Point should be the same as Decimal Point position set for process value and can not be overwritten by SETPOINT command (see RDGCNG command, described in 5.7.2).
4. To change Setpoint 1 to -100.0, send *W01A003E8 (see explanation below)

For (-100.0): Negative sign = 1, Decimal Point $2=010$ Bin, Setpoint data $1000=3 E 8$ Hex $=001111101000 \mathrm{Bin}$
The command data $=101000000000001111101000 \mathrm{Bin}=$ A003E8 Hex

## $\begin{array}{lllllll}\text { A } 0 & 0 & 3 & \mathrm{Hex}\end{array}$

## Send *W01A003E8

5. To send the same as above for RS-485 with transmit address 01 , the command is Send *01W01A003E8.

### 5.3 Response Format

Table 5.5 and 5.6 show response format with ECHO and without ECHO Mode selection.
Table 5.5 Echo Mode

| For "P" and "W" Command classes: | For "G" and "R" Command classes: | For "X","V" and "U" Command classes: | For "D", "E" and "Z" Command classes: |
| :---: | :---: | :---: | :---: |
| Point-to-point mode ccc<cr> | Point-to-point mode ccc<data> <cr> | Point-to-point mode ccc<value><cr> | Point-to-point mode ccc<cr> |
| Multipoint mode nnccc <cr> | Multipoint mode nnccc<data> <cr> | Multipoint mode nnccc<value><cr> | Multipoint mode nnccc<cr> |

## Examples:

1. Sent: *W012003E8 (Change Setpoint 1 to 100.0- see example above) Response: W01
2. Sent *R01 (Read Setpoint 1, which set to 100.0) Response: R012003E8
3. Sent: *X01 (Controller reads 75.4 F and Units set to "No") Response: X01075.4
4. Sent: *E02 (Enable Alarm 2)

Response: E02
Table 5.6 No ECHO Mode

| For "P" and "W" | For "G" and "R" <br> Command <br> clamsand | For "X",","" and "U" <br> Command <br> classes: | For "D", "E" and "Z" <br> Classes: |
| :--- | :--- | :--- | :--- |
| Command |  |  |  |
| classes: |  |  |  |

## Examples:

1. Sent: *W012003E8 (Change Setpoint 1 to 100.0 - see example above)

Response: No Response
2. Sent *R01 (Read Setpoint 1, which set to 100.0) Response 2003E8
3. Sent: *X01 (Controller reads 75.4 F and Units set to "No") Response: 075.4
4. Sent: *E02 (Enable Alarm 2)

Response: No Response
<data> in Hexadecimal format, except "U" command class, <value> reading in Decimal format

### 5.4 Error Message

The instrument is capable of detecting different errors during the Communication process and will transmit an indicating message as shown in Table 5.7 to the host computer.

Table 5.7 Error Message

|  | ERROR MESSAGE | CODE |
| :--- | :--- | :---: |
| 1 | Command Error | $? 43$ |
| 2 | Format Error | $? 46$ |
| 3 | Parity Error | $? 50$ |
| 4 | Serial Device Address Error | $? 56$ |

Where:

1. COMMAND ERROR occurs when:
a. Command prefix letter is not valid.
b. Command suffix is not valid.
2. FORMAT ERROR occurs when:
a. Length of message is either shorter or longer than it should be.
b. Any characters other than " $0-F$ " used for hexadecimal values.
3. PARITY ERROR occurs when transmitted parity does not match with parity set on the receiver.
4. Serial Device Address Error occurs if the new value is larger than 199 decimal.

Note ${ }^{185}$

1. The iLD Big Display device will not respond to a command if the command's recognition character does not match the meter's recognition character.
2. When in Multipoint mode, the device will not respond to the command if the addresses do not match.
3. If the device is in the Menu or Setpoint Mode and receives any transmitted data, it quits that routine, displays [DAm for up to 2 seconds, completes its Communication job, and then resets the device, i.e., hard reset.

### 5.5 Alarm Status Characters

The meter, upon receiving the U01 Command, will transmit the alarm status characters. Table 5.8 shows the transmitted character for each of the possible setpoint/alarm states.

Table 5.8 Alarm Status Characters

| CHARACTER | Alarm1 | Alarm2 |
| :---: | :---: | :---: |
| $@$ | OFF | OFF |
| A | ON | OFF |
| B | OFF | ON |
| C | ON | ON |

### 5.6 Examples of Transmitted Data

1. The following menu items have been selected:

Standard - RS-232, Mode - Continuous, Linefeed - No, Separation - Space, Status - No Echo - No, Reading - Yes, Valley - Yes, Peak - Yes, Unit of measurement - Yes Assume that instrument has the following data:
Reading value $=74.2^{\circ} \mathrm{F}$, Peak value $=75.1^{\circ} \mathrm{F}$, Valley value $=73.2^{\circ} \mathrm{F}$
Alarm 1 - OFF, Alarm 2 - OFF
Instrument will transmit: 74.2 75.1 73.2 F
2. The following menu items have been changed: Separation - Carriage Return Instrument will transmit: 74.2
75.1
73.2 F
3. The following menu items have been changed: Alarm Status - Yes Instrument will transmit: @
74.1
75.1
73.2 F
4. The following menu items have been changed: ECHO - Yes, Alarm 1-ON Instrument will transmit: V01

A
74.2
75.1
73.2 F

### 5.7 Command Formats

The following conditions are assumed in the examples in this section.

1. The recognition character is the asterisk (*).
2. The meter uses the RS-232 interface standard (point-to-point communication).
3. When the " W " command is given, a reset is necessary to initiate the command.
4. Each byte consist of 8 bits.
5. " " (blank) in bit pattern information means the bit is not applicable to that parameter.

## Note 1

Note that all ranges have been given decimal numbers. To make a data command, the decimal numbers are converted into a hex numbers and then the digits of that hex number are encoded into their equivalent ASCII values.

### 5.7.1 Input Type (Command Index 07)

Description: INPUT. 76543210 means 8 bit positions of the Command Data.

### 5.7.1.1 Input Type Format for Temperature/Process Instrument

| BIT POSITION |  |  |  |  |  |  |  | INPUT CLASS, RANGE OR TYPE |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
|  |  |  |  |  |  | 0 | 0 | TC (Thermocouple) |
|  |  |  |  |  |  | 0 | 1 | RTD |
|  |  |  |  |  |  | 1 | 0 | PROCESS |
|  |  |  |  |  |  |  |  | TC/ RTD/ PROCESS |
|  |  | 0 | 0 | 0 | 0 |  |  | J/ 392.2/ $0-100 \mathrm{mV}$ |
|  |  | 0 | 0 | 0 | 1 |  |  | K/ 392.3/ 0-1 V |
|  |  | 0 | 0 | 1 | 0 |  |  | T/ 392.4/ 0-10 V |
|  |  | 0 | 0 | 1 | 1 |  |  | E/ 385.2/ 0-20 mA |
|  |  | 0 | 1 | 0 | 0 |  |  | N |
|  |  | 0 | 1 | 0 | 1 |  |  | DIN-J/ 385.4 |
|  |  | 0 | 1 | 1 | 0 |  |  | R |
|  |  | 0 | 1 | 1 | 1 |  |  | S |
|  |  | 1 | 0 | 0 | 0 |  |  | B/ $\quad \mathrm{xx} / \mathrm{l}$ / x ( |
|  |  | 1 | 0 | 0 | 1 |  |  | C/ xx/ xx |
|  |  | 1 | 1 | 0 | 0 |  |  | xx/ 385.3/ xx |
| 0 | 0 |  |  |  |  |  |  | 100 ohm RTD |
| 0 | 1 |  |  |  |  |  |  | 500 ohm RTD |
| 1 | 0 |  |  |  |  |  |  | 1000 ohm RTD |

Example: Set RTD, 4 wire, .0392 Curve, 100 ohms.
The command data is $00001001 \mathrm{Bin}=09 \mathrm{HEX}$. Send: *W0709
Send a Read command first to determine the bits, which are not specified for some positions (TC and Process for positions 7,6 above).

### 5.7.1.2 Input Type Format for Process/Strain Gauge Instrument

| BIT POSITION |  |  |  |  |  | INPUT CLASS, RANGE |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :--- |
| $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ | OR TYPE |
|  |  |  |  |  |  | 0 | 0 | Voltage 0 ~ 100 mV |
|  |  |  |  |  |  | 0 | 1 | Voltage 0 ~ 1 V |
|  |  |  |  |  |  | 1 | 0 | Voltage 0 ~ 10 V |
|  |  |  |  |  |  | 1 | 1 | Voltage 0 ~ 20 mA |
|  |  |  |  |  | 0 |  |  | Ratio Disable |
|  |  |  |  |  | 1 |  |  | Ratio Enable |
|  |  |  |  | 0 |  |  |  | Low Resolution |
|  |  |  |  | 1 |  |  |  | High Resolution |
|  |  |  | 0 |  |  |  |  | Peak Value |
|  |  |  | 1 |  |  |  |  | Gross Value |

Example: Set Voltage 0 ~ 100 mV, Ratio Enabled, Low Resolution, Gross Value The command data is $00010100 \mathrm{Bin}=14 \mathrm{HEX}$. Send: *W0714

## Note ${ }^{[173}$

Send a Read command first to determine the bits, which are not specified for some positions (positions 7,6 and 5 above).

### 5.7.2 Reading Configuration: (Command Index 08)

Description: RDGCNG. 76543210 means 8 bit positions of the Command Data.

### 5.7.2.1 Reading Configuration Format for Temperature/Process Instrument

| BIT NUMBER |  |  |  |  |  | FUNCTION |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |  |
|  |  |  |  |  | 0 | 0 | 0 | Not Allowed |
|  |  |  |  |  | 0 | 0 | 1 | Decimal Point 1 (FFFF) |
|  |  |  |  |  | 0 | 1 | 0 | Decimal Point 2 (FFF.F) |
|  |  |  |  |  | 0 | 1 | 1 | Decimal Point 3 (FF.FF) |
|  |  |  |  |  | 1 | 0 | 0 | Decimal Point 4 (F.FFF) |
|  |  |  |  | 0 |  |  |  | ${ }^{\circ} \mathrm{C}$ |
|  |  |  |  | 1 |  |  |  | ${ }^{\circ} \mathrm{F}$ |
| 0 | 0 | 0 |  |  |  |  |  | Filter Constant 1 |
| 0 | 0 | 1 |  |  |  |  |  | Filter Constant 2 |
| 0 | 1 | 0 |  |  |  |  |  | Filter Constant 4 |
| 0 | 1 | 1 |  |  |  |  |  | Filter Constant 8 |
| 1 | 0 | 0 |  |  |  |  |  | Filter Constant 16 |
| 1 | 0 | 1 |  |  |  |  |  | Filter Constant 32 |
| 1 | 1 | 0 |  |  |  |  |  | Filter Constant 64 |
| 1 | 1 | 1 |  |  |  |  |  | Filter Constant 128 |

Example: Set Decimal point 1, ${ }^{\circ} \mathrm{C}$, Filter constant 16.
The command data is $10000001 \mathrm{Bin}=81 \mathrm{Hex}$. Send: *W0881
5.7.2.2 Reading Configuration Format for Process/Strain Gauge Instrument

| BIT NUMBER |  |  |  |  |  | FUNCTION |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |  |
|  |  |  |  |  | 0 | 0 | 0 | Not Allowed |
|  |  |  |  |  | 0 | 0 | 1 | Decimal Point 1 (FFFF) |
|  |  |  |  |  | 0 | 1 | 0 | Decimal Point 2 (FFF.F) |
|  |  |  |  |  | 0 | 1 | 1 | Decimal Point 3 (FF.FF) |
|  |  |  |  |  | 1 | 0 | 0 | Decimal Point 4 (F.FFF) |
|  |  |  |  | 0 |  |  |  | Load (On line Cal) Disable |
|  |  |  |  | 1 |  |  |  | Load Enable |
| 0 | 0 | 0 |  |  |  |  |  | Filter Constant 1 |
| 0 | 0 | 1 |  |  |  |  |  | Filter Constant 2 |
| 0 | 1 | 0 |  |  |  |  |  | Filter Constant 4 |
| 0 | 1 | 1 |  |  |  |  |  | Filter Constant 8 |
| 1 | 0 | 0 |  |  |  |  |  | Filter Constant 16 |
| 1 | 0 | 1 |  |  |  |  |  | Filter Constant 32 |
| 1 | 1 | 0 |  |  |  |  |  | Filter Constant 64 |
| 1 | 1 | 1 |  |  |  |  |  | Filter Constant 128 |

Example: Set Decimal point 2, Load Enable, Filter constant 4. The command data is 01010010 Bin $=81 \mathrm{Hex}$. Send: *W084A

### 5.7.3 Linearization Point (Command Index 29)

The data for number of Linearization Points (number of Scales and Offsets) has offset of -2 .
Example: Linearization Points 2 (Scale/Offset number 1 is active for the entire range) Send: *W2900

Example: Linearization Points 10 (All 9 Scale/Offset are active)
Send: *W2908

### 5.7.4 Color Display (Command Index 11)

Description: CLR. 76543210 means 8 bit positions of the Command Data.

| BIT NUMBER |  |  |  |  |  | FUNCTION |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :--- |
| $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |  |
|  |  | 0 | 0 |  |  |  |  |  |
|  |  | 0 | 1 |  |  |  |  | Alarm 2 Color AMBER |
|  |  | 1 | 0 |  |  |  |  | Alarm 2 Color GREEN |
|  |  |  |  | 0 | 0 |  |  | Alarm 2 Color RED |
|  |  |  |  | 0 | 1 |  |  | Alor AMBER |
|  |  |  |  | 1 | 0 |  |  | Alarm 1 Color GREEN |
|  |  |  |  |  |  | 0 | 0 | Alarm 1 Color RED |
|  |  |  |  |  |  | 0 | 1 | Normal Color AMBER |
|  |  |  |  |  |  | 1 | Normal Color GREEN |  |

Example: Set Normal color green, Alarm 1 color red, Alarm 2 color amber The command data is $00001001 \mathrm{Bin}=09 \mathrm{Hex}$. Send *W1109

### 5.7.5 Alarm 1 Configuration (Command Index 09)

Description: ALR1CNG. 76543210 means 8 bit positions of the Command Data.

| BIT NUMBER |  |  |  |  |  |  |  | FUNCTION |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
| 0 |  |  |  |  |  |  |  | Alarm 1 at Power On Disable |
| 1 |  |  |  |  |  |  |  | Alarm 1 at Power On Enable |
|  | 0 |  |  |  |  |  |  | Loop Break Time Disable |
|  | 1 |  |  |  |  |  |  | Loop Break Time Enable |
|  |  | 0 | 0 |  |  |  |  | Active Above |
|  |  | 0 | 1 |  |  |  |  | Active Below |
|  |  | 1 | 0 |  |  |  |  | Active Hi/Lo |
|  |  | 1 | 1 |  |  |  |  | Active Band (Deviation only) |
|  |  |  |  | 0 |  |  |  | Normally Open |
|  |  |  |  | 1 |  |  |  | Normally Closed |
|  |  |  |  |  | 0 |  |  | Unlatch |
|  |  |  |  |  | 1 |  |  | Latch |
|  |  |  |  |  |  | 0 |  | Absolute |
|  |  |  |  |  |  | 1 |  | Deviation |
|  |  |  |  |  |  |  | 0 | Disable Alarm 1 / Retransmission |
|  |  |  |  |  |  |  | 1 | Enable Alarm 1 / Retransmission |

Example:Set Alarm 1 Enable, Deviation, Unlatch, N.C., Band, Loop Disable, Alarm at Power On Enable. The command data is 10111011Bin = BBHex.
Send: *W09BB

### 5.7.6 Alarm 1 Low (Command Index 12)

Description: AL1LO.23~0 means 3 bytes x 8 bit positions of the Alarm Low Data

| AL1LO.23 $=$ | AL1LO.22~20 $=$ | AL1LO.19~0 = |
| :--- | :--- | :--- |
| $0=$ positive sign | $000-$ Not Allowed | Setpoint data |
| $1=$ negative sign | 001 - Decimal Point 1 (FFFF.) |  |
|  | 010 - Decimal Point 2 (FFF.F) |  |
|  | 011 - Decimal Point 3*(FF.FF) |  |
|  | 101 - Decimal Point 4*(F.FFF) |  |
|  | *Process only |  |

Example:Set Alarm 1 Low value to -50.0
The command data is $101000000000000111110100 \mathrm{Bin}=\mathrm{A} 001 \mathrm{~F} 4 \mathrm{Hex}$.
Send: *W12A001F4

Note ${ }^{[873}$
To set the Decimal Point for proper position see command format for RDGCNF (command index 08).

### 5.7.7 Alarm 2 Configuration (Command Index 0A)

Description: ALR2CNG. 76543210 means 8 bit positions of the Command Data.

| BIT NUMBER |  |  |  |  |  | FUNCTION |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |  |
| 1 |  |  |  |  |  |  |  | Voltage Retransmission |
|  |  | 0 | 0 |  |  |  |  | Current Retransmission |
|  |  | 0 | 1 |  |  |  |  | Active Above |
|  |  | 1 | 0 |  |  |  |  | Active Below |
|  |  | 1 | 1 |  |  |  |  | Active Hi/Lo |
|  |  |  |  | 0 |  |  |  | Active Band (Deviation only) |
|  |  |  |  | 1 |  |  |  | Normally Open |
|  |  |  |  |  | 0 |  |  | Unlatly Closed |
|  |  |  |  |  | 1 |  |  | Uatch |
|  |  |  |  |  |  | 0 |  | Absolute |
|  |  |  |  |  |  | 1 |  | Deviation |
|  |  |  |  |  |  |  | 0 | Disable |
|  |  |  |  |  |  |  | 1 | Enable |

Example: Set Alarm 2 Enable, Absolute, Latch, N.O.,Above, Current Retransmission. The command data is $10000101 \mathrm{Bin}=85 \mathrm{Hex}$. Send: *W0A85

Warning: If you change the " 0 A " to " 00 " on units with Isolated Analog Output it will disable the Alarm 2 menu.

### 5.7.8 Output 1 Configuration (Command Index 0C)

Description: OUT1CNG. 76543210 means 8 bit positions of the Command Data.

| BIT NUMBER |  |  |  |  |  | FUNCTION |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |  |
|  |  | 0 |  |  |  |  | Auto Tune PID Stop |  |
|  |  | 1 |  |  |  |  |  | Auto Tune PID Start |
|  |  |  | 0 |  |  |  |  | Anti Wind Up Disable |
|  |  |  | 1 |  |  |  |  | Anti Wind Up Enable |
|  |  |  |  |  | 0 |  |  | Auto PID Disable |
|  |  |  |  |  | 1 |  |  | Auto PID Enable |
|  |  |  |  |  |  | 0 |  | Reverse |
|  | 0 |  |  |  |  | 1 |  | Direct |
|  | 1 |  |  |  |  |  |  | Analog Proportional 0 - 20 mA |
|  |  |  |  |  |  |  | 0 | Analog proportional 4-20 mA |
|  |  |  |  |  |  |  | 1 | Time Proportional On/Off |

Example: Set PID, Direct, Auto PID Enable, Anti Integral Enable, Auto PID Stop. The command data is 00010111Bin $=2$ Fhex. Send: *WOC17

### 5.7.9 Output 2 Configuration (Command Index OD)

Description: OUT2CNG. 76543210 means 8 bit positions of the Command Data.

| BIT NUMBER |  |  |  |  |  | FUNCTION |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :--- |
| $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |  |
| 0 | 0 | 0 |  |  |  |  |  | Damping 0 |
| 0 | 0 | 1 |  |  |  |  |  | Damping 1 |
| 0 | 1 | 0 |  |  |  |  |  | Damping 2 |
| 0 | 1 | 1 |  |  |  |  |  | Damping 3 |
| 1 | 0 | 0 |  |  |  |  |  | Damping 4 |
| 1 | 0 | 1 |  |  |  |  |  | Damping 5 |
| 1 | 1 | 0 |  |  |  |  |  | Damping 6 |
| 1 | 1 | 1 |  |  |  |  |  | Damping 7 |
|  |  |  | 0 |  |  |  |  | Soak Disable |
|  |  |  | 1 |  |  |  |  | Soak Enable |
|  |  |  |  | 0 |  |  |  | Ramp Disable |
|  |  |  |  | 1 |  |  |  | Ramp Enable |
|  |  |  |  |  | 0 |  |  | Auto PID Disable |
|  |  |  |  |  | 1 |  |  | Auto PID Enable |
|  |  |  |  |  |  | 0 |  | Reverse |
|  |  |  |  |  |  | $1 w R e v e r s e A D i r e c t ~$ |  |  |
|  |  |  |  |  |  |  | 0 | Time Proportional On/Off |
|  |  |  |  |  |  |  | 1 | Time Proportional PID |

Example: Set On/Off, Reverse, Auto PID Disable, Ramp Disable, Soak Disable, Damping 4. The command data is $10000101 \mathrm{Bin}=80 \mathrm{Hex}$. Send: *W0D85

### 5.7.10 Communication Parameters (Command Index 10)

Description: COMM.PAR. 76543210 means 8 bit positions of the Command Data.

| BIT NUMBER |  |  |  |  |  | FUNCTION |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
|  | 0 |  |  |  |  |  |  | 1 Stop Bit |
|  | 1 |  |  |  |  |  |  | 2 Stop Bit |
|  |  | 0 |  |  |  |  |  | 7 Bit |
|  |  | 1 |  |  |  |  |  | 8 Bit |
|  |  |  | 0 | 0 |  |  |  | No Parity |
|  |  |  | 0 | 1 |  |  |  | Odd |
|  |  |  | 1 | 0 |  |  |  | Even |
|  |  |  |  |  | 0 | 0 | 0 | 300 Baud |
|  |  |  |  |  | 0 | 0 | 1 | 600 |
|  |  |  |  |  | 0 | 1 | 0 | 1200 |
|  |  |  |  |  | 0 | 1 | 1 | 2400 |
|  |  |  |  |  | 1 | 0 | 0 | 0 |
|  |  |  |  |  | 1 | 1 | 1 | 1 |

Example: Set Baud Rate 9600, Odd Parity, 7 Bit, 1 Stop.
The command data is 00001101Bin = ODhex. Send: *W100D

### 5.7.11 Bus Format (Command Index 1F)

Description: BUSFORMAT. 76543210 means 8 bit positions of the Command Data.

| BIT NUMBER |  |  |  |  |  | FUNCTION |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
|  |  | 0 |  |  |  |  |  | Space |
|  |  |  | 1 |  |  |  |  |  |
|  |  |  | 0 |  |  |  |  |  |
| Carriage Return |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |
|  |  |  |  | Continuous |  |  |  |  |
|  |  |  |  | 1 |  |  |  | RS-232 |
|  |  |  |  |  | 0 |  |  | RS-485 |
|  |  |  |  |  | 1 |  |  | N0 ECHO |
|  |  |  |  |  |  | 0 |  | ECHO |
|  |  |  |  |  |  | 1 |  | No Line Feed |
|  |  |  |  |  |  |  | 0 | Line Feed |
|  |  |  |  |  |  |  | 1 | No Modbus |

Example: Set Space, Continuous, RS-232, Echo, Line Feed, N/A The command data is 00000110Bin $=06 \mathrm{Hex}$. Send *W1F06

### 5.7.12 Data Format (Command Index 20)

Description: DATAFORMAT. 76543210 means 8 bit positions of the Command Data.

| BIT NUMBER |  |  |  |  |  | FUNCTION |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
|  | 0 |  |  |  |  |  |  | No Unit |
|  | 1 |  |  |  |  |  |  | Unit |
|  |  |  |  | 0 |  |  |  | No Valley or Gross |
|  |  |  |  | 1 |  |  |  | Valley or Gross |
|  |  |  |  |  | 0 |  |  | No Peak |
|  |  |  |  |  | 1 |  |  | Peak |
|  |  |  |  |  |  | 0 |  | No Reading |
|  |  |  |  |  |  | 1 |  | Reading |
|  |  |  |  |  |  |  | 0 | No Alarm Status |

Example: Set ID, Unit, No Valley, No Peak, Reading, No Status.
The command data is $11000010 \mathrm{Bin}=\mathrm{C} 2 \mathrm{Hex}$. Send: *W20C2

Note

Note ${ }^{1 \times 3}$

ADDRESS is applicable for RS-485 standard only and can be 01 to 199
TRANSMIT TIME INTERVAL is applicable for RS-232 standard and Continuous Mode, which specifies the time between transmission and the minimum time is 500 msec .

### 5.7.13 Miscellaneous (Command Index 24)

Description: MISCELLANEOUS. 76543210 means 8 bit positions of the Command Data.

| BIT NUMBER |  |  |  |  |  | FUNCTION |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
| 0 |  |  |  |  |  |  |  | SP Deviation Disable |
| 1 |  |  |  |  |  |  |  | SP Deviation Enable |
|  |  |  | 0 |  |  |  |  | Self Disable |
|  |  |  | 1 |  |  |  |  | Self Enable |
|  |  |  |  | 0 |  |  |  | Full ID Disable |
|  |  |  |  | 1 |  |  |  | Full ID Enable |
|  |  |  |  |  | 0 |  |  | Set Point ID Disable |

Example: Set SP Enable, Self Disable, Full ID Enable, Set Point ID Disable. The command data is $10001000 \mathrm{Bin}=88 \mathrm{Hex}$. Send: *W2088

### 5.7.14 \% Low and \% Hi (Command Indexes 27 and 28)

Make sure the values of \% Low and \% Hi submenus are entered correctly (\% Hi can't be more than $99 \%$ or $\% \mathrm{Hi}$ should be always more than \% Low). If values entered incorrectly, instrument will reset these values to factory defaults (\% Low = 0, \% Hi = 99 ( 63 Hex )

### 5.7.15 Reading Scale and Offset (Command Indexes 14 and 3A)

Description: RDGOFF.23~16, 15~8, 7~0 means 3 bytes $x 8$ bit positions of the Reading Offset
RDGSC.23~16, 15~8, 7~0 means 3 bytes $x 8$ bit positions of the Reading Scale

RDGOFF. 23 =
0 positive offset
1 negative offset
RDGSC.23~20 = DP+1

RDGOFF.22~20 =
DP+2

RDGSC. 19 =
0 direct scale
1 reverse scale

RDGOFF.19~0 = offset data

RDGSC.18~0 =
scale data

Example: To have an input of 4 to 20 mA displayed as 0 to 100

First make sure that the Decimal Point on your device is set to the proper position. Then, disregard the decimal point position through Scale and Offset calculation.
For instance: to display 0 to 100 set decimal point into position 1 (FFFF); to display 0 to 100.0 set decimal point into position 2 (FFF.F) then, perform Scale and Offset calculation to display 0 to 1000.

The Low input value $=$ min. input value * conversion number $=4(\mathrm{~mA}) \times 500=2000$
The High input value $=$ max. input value * conversion number $=20(\mathrm{~mA}) \times 500=10000$ (9999)
where: conversion number is a coefficient of conversion between input values and real display range.

The full range of the display $=10000$, conversion number $=10000 / 20=500$
See Table 5.9 below for proper conversion number
Table 5.9 Conversion Number

| INPUT RANGE | CONVERSION NUMBER |
| :--- | :--- |
| $0 \sim 100 \mathrm{mV}$ | $10000 /(100 \times 1)=100 \mathrm{cts} / \mathrm{mV}$ |
| $0 \sim 1 \mathrm{~V}$ | $10000 /(1000 \times 1)=10 \mathrm{cts} / \mathrm{mV}$ |
| $0 \sim 10 \mathrm{~V}$ | $10000 /(1000 \times 10)=1 \mathrm{cts} / \mathrm{mV}$ |
| $0 \sim 20 \mathrm{~mA}$ | $10000 /(20 \times 1)=500 \mathrm{cts} / \mathrm{mA}$ |

## Scaling:

$$
\begin{aligned}
& \mathbf{Y}=\mathbf{m X} \mathbf{+} \mathbf{b} \\
& \text { WHERE: } \quad \begin{array}{l}
\quad \mathrm{m}-\text { SLOPE (SCALE) } \\
\quad \mathrm{b}-\text { OFFSET }
\end{array} \\
& \mathrm{m}=\frac{(\mathrm{Y} 2-\mathrm{Y} 1)}{(\mathrm{X} 2-\mathrm{X} 1)}
\end{aligned}
$$

To remap $4-20 \mathrm{~mA}$ to a displayed reading from 0 to 100 then use slope:
Slope (Scale) $=\frac{\mathrm{Rd} 2-\mathrm{Rd} 1}{\ln 2--\ln 1 \mid}$
where: Rd2 - Hi Display reading (100), Rd1 - Low Display reading (0) In2 - Hi Input ( $20 \times 500$ ), $\quad \ln 1$ - Low Input ( $4 \times 500$ )

1. Obtain a Scale Factor

Scale $=(100-0) /(9999-2000)=0.0125016$
2. Rewrite the Scale Factor as an integer times an exponent

$$
0.0125016=125016 \text { E-7 }
$$

3. Then Encode these values

125016 Dec $=1$ E858 Hex - Reading Scale Data (RDGSC. $18 \sim 0$ value stored into bits $0-18$ );
$\mathrm{E}-7$ is represented as RDGSC. $23 \sim 20=8$ (DP = 7); Direct Scale is represented as RDGSC. 19 = 0 (direct scale);

Binary Code:

| 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 0 | 0 |  |
|  |  |  |  |  |  |  |  |  | E |  |  |  |  |  |  |  |  |  |  |  | 8 |  |  |

Send command: *W1481E858 (scale = 81E858)

## Offset:

Offset is found in the following equation: Reading = Scale $x$ Input value + Offset $(\mathrm{Y}=\mathrm{mX}+\mathrm{b})$ or the equation can be rewritten as: Offset = Reading - Scale $x$ Input Value ( $b=Y-m X$ )

1. Obtain the Offset Factor

Offset $=100-(0.0125 \times 10000)=(-25)$
2. Rewrite the Offset Factor as an integer times an exponent
$-25 \times$ E0
3. Then encode these values

25 Dec $=00019$ Hex Offset Data (RDGOFF. $19 \sim 0$ value stored into bits $0-19$ )
E0 is represented as RGDOFF. $22 \sim 20=2$ (DP $+2=0+2$ )
Offset is negative represented RDGOFF. $23=1$
Binary Code:

A
A
0

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

0

| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 1 | 1 | 0 | 0 | 1 |

1

Send command: *W03A00019 (offset=A00019)

See Appendix A for Reading Scale and Offset of Process/Strain Gage Instrument with 10 Linearization Points

### 5.7.16 Grouping Commands with the Same Formats

1. The following are of the same format as the Alarm 1 Low data format: Set Point 1 (command index 01), Set Point 2 (command index 02)
Alarm 1 High (command index 13), Alarm 2 Low (command index 15), Alarm 2 High (command index 16), C.J. Offest Adjustment (command index 25).
2. There are two commands using the same Scale-Type format:

Reading Scale (command index 14) and Analog Output Scale (command index 0F)
3. There are two commands using the same Offset-Type format:

Reading Offset (command index 03) and Analog Output Offset (command index 04)
4. Table 5.10 below shows the simple natural numbers, which have a simple data format.

Table 5.10 Commands with Numeric Data Format

| Command <br> index | Function | \# of <br> characters | Range |
| :---: | :--- | :---: | :--- |
| 05 | ID Code | 2 | $0 \sim 9999$ |
| 22 | Transmit Time Interval | 4 | $0 \sim 1999(0=500 \mathrm{~ms})$ |
| 1 A | Cycle 1 | 2 | $1 \sim 199 \mathrm{Sec}$ |
| 1D | Cycle 2 | 2 | $1 \sim 199 \mathrm{Sec}$ |
| 21 | Address | 2 | $1 \sim 199$ |
| 17 | PB1/Dead Band 1 | 4 | $0 \sim 9999$ Counts |
| 1 C | PB1/Dead Band 2 | 4 | $0 \sim 9999$ Counts |
| 18 | Reset 1 | 4 | $0 \sim 3999$ Sec |
| 19 | Rate 1 | 4 | $0 \sim 3999$ Sec |
| 27 | \%Low | 2 | $0 \sim 98 \%$ |
| 28 | \%High | 2 | $0 \sim 99 \%$ |

Example: Set Proportional Band 1 (PB 1) to 150
The command data $=0096 \mathrm{Hex}$. Send: *W170096
5. Time Formats:

Loop Break Time Value MM * 100 + SS (encoded as a 4 digit hex number)
Ramp Time
Soak Time

HH * $100+\mathrm{MM}$ (encoded as a 4 digit hex number)
HH * $100+\mathrm{MM}$ (encoded as a 4 digit hex number)

Example: Set Loop Break Time to 10 minutes 25 seconds (10:25)
The command data $=0401 \mathrm{Hex}$. Send: *W0B0401

To communicate when the Continuous Mode is enabled, the Continuous Mode must be stopped by sending Crtl S (Xoff) and then send ${ }^{\wedge} \mathrm{AE}$

## PART 6 MODBUS PROTOCOL

## Note ${ }^{[3 x}$

To Enable the Modbus Protocol, set Modbus menu item to "Yes" in the Bus
Format Submenu of the Communication Menu.

### 6.1 Introduction

Modbus Protocol defines a message structure that iLD Big Display devices will recognize and use, regardless of the type of networks over which they communicate. It describes the process a device uses to request access to another device, how it will respond to requests from the other devices, and how errors will be detected and reported. It establishes a common format for the layout and contents of message fields.

The Modbus Protocol provides the internal standard that the iLD Big Display devices use for parsing messages. During communications on a Modbus network, the protocol determines how each instrument will know its device address, recognize a message addressed to it, determine the kind of action to be taken, and extract any data or other information contained in the message. If a reply is required, the iLD Big Display will construct the reply message and send it using Modbus protocol.

Modbus defines a digital communication network to have only one MASTER and one or more SLAVE devices. Either a single (point-to-point) or multi-drop network (multipoint) is possible.
iLD Big Display devices communicate on standard Modbus networks using RTU (Remote Terminal Unit) transmission mode.

### 6.2 RTU Mode

In RTU Mode, each eight-bit byte in a message contains two four-bit hexadecimal characters. The main advantage of this mode is that its greater character density allows better data throughput than ASCII for the same baud rate. Each message must be transmitted in a continuous stream.

## The following format used for each byte sent and received by i-Series instrument in RTU Mode:

1. Eight-bit binary, Hexadecimal ( 0 ... 9, A ... F)
2. Two hexadecimal characters contained in each eight-bit field of the message
3. 1 start bit, 8 data bits, 1 Stop Bit (No Parity Bit)

The figure below shows the bit sequences when byte transmitted in RTU Mode.
LSB MSB

| START | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | STOP |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

LSB - Least Significant bit sent first

The Modbus Message frame is shown below

| DEVICE | FUNCTION | DATA | CRC |
| :---: | :---: | :---: | :---: |
| ADDRESS | CODE |  | CHECK |
| 8 BITS | 8 BITS |  |  |
| nn | nn | $\mathrm{k} \times 8$ BITS | 16 BITS |
| nnn... | nnnn |  |  |

where: n - character, k - integers depend on the contents of the data format.

### 6.3 Device Address

The address message frame contains eight bits. The slave device addresses are in the range of 1 ... 199 decimal. A master addresses a slave by placing the slave address in the address field of the message. When the slave sends its response, it places its own address in this address field of the response to let the master know which slave is responding. Address 0 is used for the write command broadcast that commands all devices on network, which all slave devices recognize.

### 6.4 Function Code

The function code field of a message frame contains eight bits (RTU). Valid codes are in the range of $1 \ldots 255$ decimal. Of these, some codes are applicable for i-Series controllers. When a message is sent from a master to a slave device the function code field tells the slave what kind of action to perform.

The following functions are supported by iLD Big Display devices:

## Table 6.1 Function Code

| Function Code | Function | Description |
| :--- | :--- | :--- |
| 03 | Read holding register | Reads the binary contents of holding <br> registers in the slave |
| 04 | Read input register | Reads the binary contents of input register <br> in the slave. |
| 06 | Preset (Write to) <br> single register | Preset (Write) a value into single holding <br> register |
| 08 | Diagnostic | Series of tests for checking communication <br> between master and slave |

When the slave responds to the master, it uses the function code field to indicate either a normal (error-free) response or that some kind of error occurred (called an exception response). For a normal response, the slave simply echoes the original function code. For an exception response, the slave returns a code that is equivalent to the original function code with its most significant bit set to a logic 1.

### 6.5 Data Field

The data field is constructed using sets of two hexadecimal digits, in the range of 00 to FF hexadecimal. The data field of messages sent from a master to slave devices contains additional information, which the slave must use to take the action defined by the function code. This can include items like discrete and register addresses, the quantity of items to be handled, and the count of actual data bytes in the field.

### 6.6 CRC Checking

With RTU Mode the error checking field contains a 16 -bit value implemented as two eight-bit bytes (High order byte and Low order byte). The error check value is the result of a Cyclical Redundancy Check (CRC) Calculation performed on the message contents. After building a message (address, function code, data) the transmitting device calculates a CRC Code and puts it to the end of the message. A receiving device will calculate a CRC Code from the message it has received and compare against transmitted CRC Code. If these CRC Codes are different, there has been a communication error. iLD Big Display devices will not reply if they detect a CRC Error.

Sequences of CRC calculation:

1. Load a 16 bit CRC register with all 1 's.
2. Apply first 8 bit byte of the message to the low order byte (LB) of the contents of the register.
3. Exclusive OR these 8 bit with the register contents.
4. Shift the result one bit to the right with zero entering into the high order byte (HB) position and evaluate the LB.
5. If over flow bit in LB is 1 , exclusive OR the latest register contents with A001 Hex value.
6. If over flow bit in LB is 0 , no exclusive OR occurs (repeat step 4).
7. Repeat steps 4,5 and 6 until 8 shifts have been performed.
8. Apply next 8 bit byte of the message to the LB contents of the register.
9. Exclusive OR these 8 bit with the register contents.
10. Repeat steps 4 to 9 until all bytes of the message have been processed.
11. The final content of the register is the CRC value.

## Examples of CRC calculation sees in Appendix B

When CRC is placed into the end of the message, the low order byte of the CRC will be transmitted first, followed by the High order byte.

### 6.7 Modbus RTU Registers

The table below shows the Modbus registers supported by iLD Big Display devices.
Table 6.2 Modbus Registers

| $\begin{gathered} \text { FUNCTION } \\ \text { CODE } \end{gathered}$ | REGISTER | FUNCTION | VALUE, RANGE (Decimal) |
| :---: | :---: | :---: | :---: |
| NO | 0 | N/A |  |
| 03/04, 06 | 1 | SETPOINT 1 | -1999 to 1999 |
| 03/04, 06 | 2 | SETPOINT 2 | -1999 to 1999 |
| NO | 3 | N/A |  |
| NO | 4 | N/A |  |
| 03/04, 06 | 5 | ID | 0 to 9999 |
| NO | 6 | N/A |  |
| 03/04, 06 | 7 | INPUT | 0 to 255 |
| 03/04, 06 | 8 | RDGCNF | 0 to 255 |
| 03/04, 06 | 9 | ALR1CNF | 0 to 255 |
| 03/04, 06 | 10 | ALR2CNF | 0 to 255 |
| 03/04, 06 | 11 | LOOP BREAK TIME | 00:00 to 99:59 |
| 03/04, 06 | 12 | OUT1CNF | 0 to 255 |
| 03/04, 06 | 13 | OUT2CNF | 0 to 255 |
| 03/04, 06 | 14 | RAMP TIME | 00:00 to 99:59 |
| NO | 15 | N/A |  |
| 03/04, 06 | 16 | COMM. PARAMETERS | 0 to 255 |
| NO | 17 | N/A |  |
| 03/04, 06 | 18 | ALR1 LOW | -1999 to 9999 |
| 03/04, 06 | 19 | ALR1 HI | -1999 to 9999 |
| NO | 20 | N/A |  |
| 03/04, 06 | 21 | ALR2 LOW | -1999 to 9999 |
| 03/04, 06 | 22 | ALR2 HI | -1999 to 9999 |
| 03/04, 06 | 23 | PB1/DEAD BAND 1 | 0 to 9999 |
| 03/04, 06 | 24 | RESET 1 | 0 to 3999 |
| 03/04, 06 | 25 | RATE 1 | 0 to 399.9 1 to 199 |
| NO | 27 | N/A |  |
| 03/04, 06 | 28 | PB2/DEAD BAND 2 | 0 to 9999 |
| 03/04, 06 | 29 | CYCLE 2 | 1 to 199 |
| 03/04, 06 | 30 | SOAK TIME | 00:00 to 99:59 |
| 03/04, 06 | 31 | BUS FORMAT | 0 to 255 |
| 03/04, 06 | 32 | DATA FORMAT | 0 to 255 |
| 03/04, 06 | 33 | ADDRESS | 0 to 199 |
| 03/04, 06 | 34 | TRANSIT TIME | 0 to 9999 |
| NO | 35 | N/A |  |
| NO | 36 | N/A |  |
| NO | 37 | N/A |  |
| 03/04, 06 | 38 | RECOGNITION CHAR. | 32 to 126 |
| 03/04 | 39 | PROCESS VALUE |  |
| 03/04 | 40 | PEAK VALUE |  |
| 03/04 | 41 | VALLEY VALUE |  |
| 03/04 | 42 | SOFTWARE VERSION |  |

### 6.8 Command Format

The following formats are used to SEND commands by computer and RETURNED by the device.

### 6.8.1 Read Multiple Register (03 or 04)

SENT TO DEVICE:

| DEVICE | FUNCTION CODE03 or 04 | DATA |  |  |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADDRESS |  | STARTING REGISTERS |  | NUMBER OF REGISTERS |  |  |  |
| $\begin{gathered} \hline 1 \text { BYTE } \\ \mathrm{nn} \end{gathered}$ | $\begin{gathered} \hline 1 \text { BYTE } \\ 03 \end{gathered}$ | $\begin{aligned} & \text { HB } \\ & 00 \end{aligned}$ | $\begin{aligned} & \text { LB } \\ & \text { nn } \end{aligned}$ | $\begin{aligned} & \mathrm{HB} \\ & 00 \end{aligned}$ | $\begin{aligned} & \text { LB } \\ & \mathrm{nn} \end{aligned}$ | LB | $\begin{aligned} & \hline \mathrm{HB} \\ & \mathrm{nn} \end{aligned}$ |

## RETURNED FROM DEVICE:

| DEVICE | FUNCTION CODE03 or 04 | DATA |  |  |  |  |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADDRESS |  | NUMBER OF BYTES | $\begin{gathered} \text { FIRST } \\ \text { REGISTER } \end{gathered}$ |  | $\ldots$ | REG | STER |  |  |
| $\begin{gathered} 1 \text { BYTE } \\ \mathrm{nn} \end{gathered}$ | $\begin{gathered} 1 \text { BYTE } \\ 03 \\ \hline \end{gathered}$ | $\begin{gathered} 1 \text { BYTE } \\ \mathrm{nn} \end{gathered}$ | $\begin{aligned} & \mathrm{HB} \\ & \mathrm{nn} \end{aligned}$ | $\begin{aligned} & \text { LB } \\ & \text { nn } \end{aligned}$ | $\cdots$ | $\mathrm{HB}$ | LB | $\begin{aligned} & \text { LB } \\ & \text { nn } \end{aligned}$ | HB nn |

Where: HB - High Order Byte

> LB - Lower Order Byte

Unused bits are set to zero

Note ${ }^{12}$
iLD Big Display devices support only Read Single Register, so the number of registers should always set to 1 .

## Example:

SENT TO DEVICE: Address 1, Read (03) register 1 (Setpoint 1)

| DEVICE | FUNCTION | STARTING |  | NUMBER OF |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADDRESS | CODE | REGISTER |  | REGISTERS |  |  |  |
| 01 | 03 | 00 | 01 | 00 | 01 | D5 | CA |

Noters To determine the appropriate registers see Table 6.2

RETURNED FROM DEVICE: Setpoint 1 set to 100.0

| DEVICE ADDRESS | FUNCTION CODE | NUMBER OF BYTES | VALUE OF REGISTERS | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 01 | 03 | 02 | 03 E8 | B8 | FA |

03E8 Hex $=1000$ Dec
These returned data do not specify the Decimal Point position. The following command will determine the Decimal Point position.

## Example:

SENT TO DEVICE: Address 09, Read (03) register 08 (Reading Configuration)

| DEVICE | FUNCTION | STARTING |  | NUMBER OF |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADDRESS | CODE | REGISTER |  | REGISTERS |  |  |  |
| 09 | 03 | 00 | 08 | 00 | 01 | 04 |  |

RETURNED FROM DEVICE:

| DEVICE | FUNCTION | NUMBER OF | VALUE OF |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADDRESS | CODE | BYTES | REGISTERS |  |  |  |
| 09 | 03 | 02 | 00 | 4 A | D8 | 72 |

004A Hex $=01001010$ Bin. This value calls for Decimal Point position number 2 (FFF.F)

- see example in 5.7.2 for Reading Configuration.

### 6.8.2 Write to Single Register (06)

The following command will write a parameter to the single register.
Sent to/Return from device :

| DEVICE ADDRESS | $\begin{gathered} \text { FUNCTION CODE } \\ 06 \end{gathered}$ | DATA |  |  |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | REGISTER |  | DATA/ VALUE |  |  |  |
| $\begin{gathered} 1 \text { BYTE } \\ \mathrm{nn} \end{gathered}$ | $\begin{gathered} 1 \text { BYTE } \\ 06 \end{gathered}$ | $\begin{aligned} & \mathrm{HB} \\ & 00 \end{aligned}$ | $\begin{aligned} & \text { LB } \\ & \text { nn } \end{aligned}$ | HB 00 | LB nn | LB | $\mathrm{HB}$ |

Example: Set Alarm1 Low (register 18) to 300 Dec (12C Hex)
SEND TO DEVICE: Address 20 (14 Hex), write (06) to register 18 (12 Hex) value 300 (12C Hex)

| DEVICE | FUNCTION | REGISTER |  | DATA/ |  | VALUE |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADDRESS | CODE | CRC |  |  |  |  |  |
| 14 | 06 | 00 | 12 | 01 | 2C | 2B | 47 |

RETURNED FROM DEVICE:

| DEVICE <br> ADDRESS | FUNCTION <br> CODE | REGISTER |  | DATA/ <br> VALUE |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 14 | 06 | 00 | 12 | 01 | 2C | 2 AB | 47 |

[^1]Example: Set Alarm2 Low to - 100.0 on Device address 20
We have to send two commands to accomplish this task.
First, we have to set decimal point into the position 2 (FFF.F) and then, set value of Alarm 2 Low to -1000 counts (disregard decimal point).

## 1. Set Decimal Point

Set the Decimal point to the position 2 (FFF.F), Temperature unit ${ }^{\circ}$ F, Filter constant 4 - see example in 5.7.2

SEND TO DEVICE: Address 20 (Hex 14), write (06) to register 8, data 4A

| DEVICE <br> ADDRESS | FUNCTION <br> CODE | REGISTER |  | DATA/ <br> VALUE |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 14 | 06 | 00 | 08 | 00 | $4 A$ | $8 B$ | 3 A |

## RETURNED FROM DEVICE:

| $\begin{gathered} \text { DEVICE } \\ \text { ADDRESS } \\ \hline \end{gathered}$ | FUNCTION CODE | REGISTER |  | DATA/ VALUE |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 14 | 06 | 00 | 08 | 00 | 4A | 8B | 3A |

2. Conversion the Decimal value of $(-1000)$ to Hexadecimal Value:
$\mathrm{N}=+1000 \mathrm{Dec}=0000001111101000 \mathrm{Bin}=2$ bytes or 16 bits
1 's complement of $\mathrm{N}=1111110000010111 \mathrm{Bin}=\operatorname{Not} \mathrm{N}$
2 's complement of $\mathrm{N}=1111110000011000 \mathrm{Bin}=1$ 's complement of $\mathrm{N}+1 \mathrm{LSB}$ F C 18 Hex

SEND TO DEVICE: Address 20 (14 Hex), write (06) to register 21 (15 Hex) value (-1000) (FC18 Hex)

| DEVICE | FUNCTION | REGISTER |  | DATA/ |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADDRESS | CODE |  |  |  |  |  |  |
| 14 | 06 | 00 | 15 | FC | 18 | DB |  |
| C1 |  |  |  |  |  |  |  |

RETURNED FROM DEVICE:

| DEVICE <br> ADDRESS | FUNCTION <br> CODE | REGISTER |  | DATA/ <br> VALUE |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 14 | 06 | 00 | 15 | FC | 18 | DB | C1 |

## Noters

For examples of how to Read/Write data code for INPUT, RDGCNF, ALR1CNF, ALR2CNFG, OUT1CNF, OUT2CNF, COLOR, COMM.PARAMETERS, BUSFORMAT, DATAFORMAT see section 5.7 of this manual.

### 6.8.3 Diagnostic Command

This command echoes the sent message to indicate that the communication link is established correctly.

SEND TO/RETURN FROM DEVICE:

| DEVICE | FUNCTION | DIAGNOSTIC |  | LOOPBACK | CRC |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADDRESS | CODE | CODE |  | DATA |  |  |  |
| 1 BYTE | 1 BYTE | HB | LB | HB | LB | LB | HB |
| nn | 08 | 00 | 00 | nn | nn | nn | nn |

Where: Diagnostic Code is two byte code to determine the type of test to be performed. iLD Big Display devices supported only " 00 " code which requested slave to echo sent command back to the master.

## Example:

SEND TO DEVICE: Address 01, Diagnostic command (08), data value 8755 Dec (2233 Hex)

| DEVICE <br> ADDRESS | FUNCTION <br> CODE | DIAGNOSTIC <br> CODE |  | LOOPBACK <br> DATA |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 01 | 08 | 22 | 33 | 00 | 00 | BE | B8 |

RETURNED FROM DEVICE:

| DEVICE ADDRESS | FUNCTION CODE | $\begin{gathered} \text { DIAGNOSTIC } \\ \text { CODE } \end{gathered}$ |  | $\begin{gathered} \text { LOOPBACK/ } \\ \text { DATA } \end{gathered}$ |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 01 | 08 | 22 | 33 | 00 | 00 | BE | B8 |

### 6.8.4 Error Response

When a device can not properly respond to the command due to incorrect or corrupted command, it will respond with an error message. The error massage has the following format:

| DEVICE | FUNCTION | ERROR | CRC |  |
| :---: | :---: | :---: | :---: | :---: |
| ADDRESS | CODE | RESPONSE |  |  |
| 1 BYTE | 1 BYTE | 1 BYTE | LB | HB |
| nn | nn | nn | nn | nn |

iLD Big Display devices support the following error code messages:
02 - read from/write to the illegal register - read from/write to the register, which is inactive, or not supported by iLD Big Display devices
03 - write an illegal value - write out of range value

## Example:

SEND TO DEVICE: Address 05, read (03) register 04 - inactive (see Table 6.2)

| DEVICE |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADDRESS | | FUNCTION |
| :---: |
| CODE |$\quad$| STARTING <br> REGISTER |  | NUMBER OF <br> REGISTERS |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 05 |  |  |  |  |  |

RETURNED FROM DEVICE:

| DEVICE | FUNCTION <br> ADDRESS | ERROR <br> CODE | CRC |  |
| :---: | :---: | :---: | :---: | :---: |
| 05 | 83 | 02 | 81 | 30 |

## Example:

SEND TO DEVICE: Address 120 (Hex 78), write (06) to register 35 (Hex 23) - inactive (see Table 6.2)

| DEVICE <br> ADDRESS | FUNCTION <br> CODE | REGISTER |  | DATA/ <br> VALUE |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 78 | 06 | 00 | 23 | 00 | 00 | 73 | A9 |

## RETURNED FROM DEVICE:

| DEVICE | FUNCTION | ERROR | CRC |  |
| :---: | :---: | :---: | :---: | :---: |
| ADDRESS | CODE | RESPONSE |  |  |
| 78 | 86 | 02 | 12 | 78 |

## Example:

SEND TO DEVICE: Address 01, write (06) to register 12 (Hex C) value 300 (Hex 12C) -out of range (see Table 6.2)

| $\begin{gathered} \hline \text { DEVICE } \\ \text { ADDRESS } \end{gathered}$ | $\begin{gathered} \hline \text { FUNCTION } \\ \text { CODE } \\ \hline \end{gathered}$ | REGISTER |  | DATA/ VALUE |  | CRC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 01 | 06 | 00 | 0C | 01 | 2 C | 49 | 84 |

RETURNED FROM DEVICE:

| DEVICE | FUNCTION | ERROR | CRC |  |
| :---: | :---: | :---: | :---: | :---: |
| ADDRESS | CODE | RESPONSE |  |  |
| 01 | 86 | 03 | 02 | 61 |

[^2]
## APPENDIX A

Reading Scale and Offset for Process/Strain Gage Instrument with 10 Linearization Points (Command Indexes 2B to 33, 34 to 3C, 3D to 45)

Description: RDGOFF.23~16, 15~8, 7~0 means 3 bytes $x 8$ bit positions of the Reading Offset
RDGSC.23~16, 15~8, 7~0 means 3 bytes $x 8$ bit positions of the Reading Scale

## RDGOFF. 23 =

0 positive offset
1 negative offset
RDGSC.23~20 = DP+1

RDGOFF.22~20 =
DP+2

RDGSC. 19 =
0 direct scale 1 reverse scale

RDGOFF.19~0 = offset data

RDGSC.18~0 = scale data

## Example:

The following example assumes load cells with this specification:
Maximum Load: 100 lbs
Output:
$3.0 \mathrm{mV} / \mathrm{V}$
Sensor Excitation: 10 Vdc
Maximum Sensor Output $=($ Output $) \times($ Sensor Excitation) $=3.0(\mathrm{mV} / \mathrm{V}) \times 10(\mathrm{~V})=30 \mathrm{mV}$ Input Value (In) = (Sensor Output) x (Conversion Number) x (Multiplier)
See Tables A. 1 and A. 2 below for proper Conversion and Multiplier Numbers.
Table A. 1 Conversion Number

| INPUT RANGE | CONVERSION NUMBER |
| :--- | :--- |
| $0 \sim 100 \mathrm{mV}$ | $10000 /(100 \times 1)=100 \mathrm{cts} / \mathrm{mV}$ |
| $0 \sim 1 \mathrm{~V}$ | $10000 /(1000 \times 1)=10 \mathrm{cts} / \mathrm{mV}$ |
| $0 \sim 10 \mathrm{~V}$ | $10000 /(1000 \times 10)=1 \mathrm{cts} / \mathrm{mV}$ |
| $0 \sim 20 \mathrm{~mA}$ | $10000 /(20 \times 1)=500 \mathrm{cts} / \mathrm{mA}$ |

Table A. 2 Input Resolution Multiplier

| INPUT RANGE | RESOLUTION |  |
| :---: | :---: | :---: |
|  | LOW | HIGH |
| $0 \sim 100 \mathrm{mV}$ | 1.0 | 10.0 |
| $0 \sim 1 \mathrm{~V}$ | 1.0 | 10.0 |
| $0 \sim 10 \mathrm{~V}$ | 1.0 | 10.0 |
| $0 \sim 20 \mathrm{~mA}$ | 1.0 | 10.0 |

Determine IN min and IN max Input Range and Resolution. For our transducer select $0-100 \mathrm{mV}$ range and Low resolution.

IN $\min =0(\mathrm{mV}) \times 100(\mathrm{cts} / \mathrm{mV}) \times 1.0=0$
IN max $=30(\mathrm{mV}) \times 100(\mathrm{cts} / \mathrm{mV}) \times 1.0=3000$

Determine correct values for Display reading (Rd min and Rd max). In most cases, Rd min and Rd max are equal to the minimum and maximum of the transducer output range.

Rd $\min =0$
$R d \max =100.0$
We have to scale our meter to have an input 0 to $3000(30 \mathrm{mV})$ displayed as 0 to 100.0 (Ibs)
Assume that the shape of the transducer response characteristic is equal to the shape of the parabola ( $\mathrm{Y}=\mathrm{KX} \mathrm{X}^{\wedge}$ )

Output $=K \times$ Input^2, there $K=$ Output $/ \operatorname{Input} \wedge 2=100.0 /\left(3000^{\wedge} 2\right)=1 /\left(9 \times 10^{\wedge} 4\right)$
Output $=\operatorname{Input}{ }^{\wedge} 2 /\left(9 \times 10^{\wedge} 4\right)$
Let's build the response characteristic of our transducer based on the seven inputs within the range of the transducer ( 7 linearization points)

Input $(\mathrm{X}): \ln 1=0|\ln \mathbf{2 = 5 0 0}| \ln \mathbf{3 = 1 0 0 0}|\ln 4=1500| \ln 5=2000|\ln 6=2500| \ln \mathbf{7 = 3 0 0 0}$
Output (Y): Rd 1=0 $\mid$ Rd 2=2.8 $\mid$ Rd 3=11.0| Rd 4=25.0 $\mid$ Rd 5=44.4 $|\operatorname{Rd} 6=69.4| \operatorname{Rd} 7=100.0$

## Output

The following commands need to be sent to the meter to create this response characteristic.

First make sure that the Decimal Point on your device is set to the proper position. Then, disregard the decimal point position through Scale and Offset calculation. For instance: to display 0 to 100 set decimal point into position 1 (FFFF); to display 0 to 100.0 set decimal point into position 2 (FFF.F) then, perform Scale and Offset calculation to display 0 to 1000.

1. The command for the number of linearization points is 29 (Table 5.4) and the data has an offset of -2. Send command: *W2905 means 7 points of linearization are active.
2. Out of ten points the very first one is not available through the communication commands. The nine points from 1st to 9th must represent min and max of each interval respectively, and the points in between them must be progressively incrementing. The commands for these points are 2B to 33 (Table 5.4)
2.1 Send command: *W2B2001F4 means 5 mV input for Scale 1/Offset 1 is active, DP=2
2.2 Send command: *W2C2003E8 means 10 mV input for Scale 2/Offset 2 is active, DP=2
2.3 Send command: *W2D2005DC means 15 mV input for Scale 3/Offset 3 is active, DP=2
2.4 Send command: *W2E2007DO means 20 mV input for Scale 4/Offset 4 is active, DP=2
2.5 Send command: *W2F2009C4 means 25 mV input for Scale $5 /$ Offset 5 is active, DP=2
2.6 Send command: *W30200BB8 means 30 mV input for Scale 6/Offset 6 is active, DP=2
3. Calculate Scale.

The commands for these points are 34 to 3C (Table 5.4)
3.1 Scale $1=(28-0) /(500-0)=56000 \times$ E-6
56000 Dec $=$ DAC0 Hex is a Reading Scale Data (RDGSC1.18~0 = DAC0)
E-6 represented as RDGSC1.23~20 $=7$ (DP $+1=7$ )
RDGSC1.19 =0 (direct scale)
Send command: *W3470DAC0
3.2 Scale $2=(110-28) /(1000-500)=164000 \times$ E- 6

RDGSC2.18~0 = 164000 Dec = 280A0 Hex
RDGSC2.23~20 $=7$
RDGSC2.19~0 = 0
Send command: *W357280A0
3.3 Scale $3=(250-110) /(1500-1000)=280000 \times$ E-6

RDGSC3.18~0 $=280000$ Dec $=445 \mathrm{CO} \mathrm{Hex}$
RDGSC3.23~20 $=7$
RDGSC3.19~0 = 0
Send command: *W367445C0
3.4 Scale $4=(444-250) /(2000-1500)=388000 \times$ E-6

RDGSC4.18~0 $=388000$ Dec $=5$ EBAO Hex
RDGSC4.23~20 $=7$
RDGSC4.19~0 = 0
Send command: *W3775EBA0
3.5 Scale $5=(694-444) /(2500-2000)=500000 \times$ E-6

RDGSC5.18~0 = $500000 \mathrm{Dec}=7 \mathrm{~A} 120 \mathrm{Hex}$
RDGSC5.23~20 = 7
RDGSC5.19~0 = 0
Send command: *W3877A120
3.6 Scale $6=(1000-694) /(3000-2500)=612000 \times$ E-6

RDGSC6.18~0 = 612000 Dec $=956$ A0 Hex
RDGSC6.23~20 $=7$
RDGSC6.19~0 = 0
Send command: *W397956A0
4. Calculate Offset.

Reading = Scale x Input + Offset
Offset ( n ) = Reading ( n ) - Scale ( n ) $x \operatorname{Input}(\mathrm{n}$ ), where n is an integer
The commands for these points are 3D to 45 (Table 5.4)
4.1 Offset $1=28-(28-0) /(500-0) \times 500=0$
RDGOFF1.19~0 $=0$ Dec $=0$ Hex
RDGOFF1.22~20 $=2($ (DP+2)
RDGOFF1.23 $=1$ (Offset is negative)
Send command: *W3DA00000
4.2 Offset $2=110-(110-28) /(1000-500) \times 1000=-54 \times$ E0

RDGOFF2.19~0 = $54 \mathrm{Dec}=36 \mathrm{Hex}$
RDGOFF2.22~20 = 2 (DP+2)
RDGOFF2.23 = 1 (Offset is negative)
Send command: *W3EA00036
4.3 Offset $3=250-(250-110) /(1500-1000) \times 1500=-170 \times$ E0

RDGOFF3.19~0 $=170$ Dec = AA Hex
RDGOFF3.22~20 = 2 (DP+2)
RDGOFF3.23 = 1 (Offset is negative)
Send command: *W3FA000AA
4.4 Offset $4=444-(444-250) /(2000-1500) \times 2000=-332$

RDGOFF4.19~0 = 332 Dec = 14C Hex
RDGOFF4.22~20 = 2 (DP+2)
RDGOFF4.23 = 1 (Offset is negative)
Send command: *W40A0014C
4.5 Offset $5=694-(694-444) /(2500-2000) \times 2500=-556$

RDGOFF5.19~0 = 556 Dec $=22 \mathrm{CHex}$
RDGOFF5.22~20 = 2 (DP+2)
RDGOFF5.23 = 1 (Offset is negative)
Send command: *W41A0022C
4.6 Offset $6=1000-(1000-694) /(3000-2500) \times 3000=-836$

RDGOFF6.19~0 = 836 Dec $=344 \mathrm{Hex}$
RDGOFF6.22~20 = 2 (DP+2)
RDGOFF6.23 = 1 (Offset is negative)
Send command: *W42A00344

A Hard reset command (*Z02) should be sent at the end in order to load the changes into Volatile memory.

## Example of CRC calculation in "C" language

This subroutine used to do CRC calculation

## \#define POLY 0xA001;

unsigned int crc_calculation (unsigned char *start_string, unsigned char number_byte) \{
unsigned int crc;
unsigned char bit_counter; unsigned char *data_pointer;
data_pointer= start_string;
crc = 0xffff; $\quad / /$ Initialize crc
while (number_byte>0)
\{
$\operatorname{crc}^{\wedge}=$ data_pointer $\quad / / \mathrm{crc}$ XOR with data bit_counter=0; // reset counter
while (bit_counter < 8)
\{
if ( $\operatorname{crc} \& 0 \times 0001$ )
\{
crc >>= 1; // shift to the right 1 position $\operatorname{crc}^{\wedge}=$ POLY; $/ / \operatorname{crc}$ XOR with POLY \}
else
\{
crc >>=1; // shift to the right 1 position \}
bit_counter++; \}
number_byte--; // adjust byte counter
\}
return (crc); // final result of crc

## APPROVAL INFORMATION

## 1. Electromagnetic Compatibility (EMC)

This device comforms with requirements of EMC Directive 89/336/EEC, amended by $93 / 68 / E E C$. This instrument complies with the following EMC Immunity Standards as tested per EN 50082-2, 1995 (Industrial environment)

| Phenomena | Test Specification | Basic Standard |
| :--- | :--- | :--- |
| Electrostatic <br> Discharge | $+/-4 \mathrm{kV}$ contact discharge <br> $+/-8 \mathrm{kV}$ air discharge | IEC 1000-4-2 <br> Performance <br> Criteria B |
| Radio Frequency <br> electromagnetic <br> field. | $27-1000 \mathrm{MHz}$ <br> $10 \mathrm{~V} / \mathrm{m}$ <br> $80 \% \mathrm{AM} \mathrm{(1KHz)}$ | IEC 1000-4-3 <br> Performance <br> Criteria A |
| Radio Frequency | 900 MHz | IEC 1000-4-3 |
| electromagnetic field. | $10 \mathrm{~V} / \mathrm{m}$ |  |
| Pulse modulated. | $50 \%$ Duty cycle @ 200 Hz | Performance |
| Criteria A |  |  |

This instrument complies with the following EMC Emission Standards as tested per EN 50081-1, 1992 (Residential, Commercial and Light Industrial)

| Phenomena | Frequency <br> Range | Limits | Basic <br> Standard |
| :--- | :--- | :--- | :--- |
| Radiated <br> Emission | $30-230 \mathrm{MHz}$ <br> $230-1000 \mathrm{MHz}$ | $30 \mathrm{~dB}, \mathrm{~V} / \mathrm{m}$ at 10 m <br> $37 \mathrm{~dB} \mathrm{~V} / \mathrm{m}$ at 10 m <br> quasi peak | CISPR 22 <br> Class B |
| Conducted | $0.15-0.5 \mathrm{MHz}$ <br> Emission | $66-56 \mathrm{~dB}$ V quasi peak <br> $0.5-5 \mathrm{MHz}$ <br> $5-30 \mathrm{MHz}$ | 56 dB V quasi peak <br> 60 dB V quasi peak | CISPR 22 | Class B |
| :--- |

## 2.Safety

This device conforms with Low Voltage Directive 73/23/EEC, amended by 93/68/EEC.
The following LVD requirements have been met to comply with EN 61010-1, 1993
(Electrical equipment for measurement, control and laboratory use)

1. Pollution Degree 2
2. Installation Category II
3. Double Insulation
4. Class I Equipment (Units with 100-240 Vac Power)

## WARRANTY/DISCLAIMER

OMEGA ENGINEERING, INC. warrants this unit to be free of defects in materials and workmanship for a period of $\mathbf{6 1}$ months from date of purchase. OMEGA's WARRANTY adds an additional one (1) month grace period to the normal five (5) year product warranty to cover handling and shipping time. This ensures that OMEGA's customers receive maximum coverage on each product.
If the unit malfunctions, it must be returned to the factory for evaluation. OMEGA's Customer Service Department will issue an Authorized Return (AR) number immediately upon phone or written request. Upon examination by OMEGA, if the unit is found to be defective, it will be repaired or replaced at no charge. OMEGA's WARRANTY does not apply to defects resulting from any action of the purchaser, including but not limited to mishandling, improper interfacing, operation outside of design limits, improper repair, or unauthorized modification. This WARRANTY is VOID if the unit shows evidence of having been tampered with or shows evidence of having been damaged as a result of excessive corrosion; or current, heat, moisture or vibration; improper specification; misapplication; misuse or other operating conditions outside of OMEGA's control. Components in which wear is not warranted, include but are not limited to contact points, fuses, and triacs.
OMEGA is pleased to offer suggestions on the use of its various products. However, OMEGA neither assumes responsibility for any omissions or errors nor assumes liability for any damages that result from the use of its products in accordance with information provided by OMEGA, either verbal or written. OMEGA warrants only that the parts manufactured by the company will be as specified and free of defects. OMEGA MAKES NO OTHER WARRANTIES OR REPRESENTATIONS OF ANY KIND WHATSOEVER, EXPRESSED OR IMPLIED, EXCEPT THAT OF TITLE, AND ALL IMPLIED WARRANTIES INCLUDING ANY WARRANTY OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE HEREBY DISCLAIMED. LIMITATION OF LIABILITY: The remedies of purchaser set forth herein are exclusive, and the total liability of OMEGA with respect to this order, whether based on contract, warranty, negligence, indemnification, strict liability or otherwise, shall not exceed the purchase price of the component upon which liability is based. In no event shall OMEGA be liable for consequential, incidental or special damages.
CONDITIONS: Equipment sold by OMEGA is not intended to be used, nor shall it be used: (1) as a "Basic Component" under 10 CFR 21 (NRC), used in or with any nuclear installation or activity; or (2) in medical applications or used on humans. Should any Product(s) be used in or with any nuclear installation or activity, medical application, used on humans, or misused in any way, OMEGA assumes no responsibility as set forth in our basic WARRANTY/DISCLAIMER language, and, additionally, purchaser will indemnify OMEGA and hold OMEGA harmless from any liability or damage whatsoever arising out of the use of the Product(s) in such a manner.

## RETURN REOUESTS/INQUIRIES

Direct all warranty and repair requests/inquiries to the OMEGA Customer Service Department. BEFORE RETURNING ANY PRODUCT(S) TO OMEGA, PURCHASER MUST OBTAIN AN AUTHORIZED RETURN (AR) NUMBER FROM OMEGA'S CUSTOMER SERVICE DEPARTMENT (IN ORDER TO AVOID PROCESSING DELAYS). The assigned AR number should then be marked on the outside of the return package and on any correspondence.
The purchaser is responsible for shipping charges, freight, insurance and proper packaging to prevent breakage in transit.

FOR WARRANTY RETURNS, please have the following information available BEFORE contacting OMEGA:

1. Purchase Order number under which the product was PURCHASED,
2. Model and serial number of the product under warranty, and
3. Repair instructions and/or specific problems relative to the product.

FOR NON-WARRANTY REPAIRS, consult OMEGA for current repair charges. Have the following information available BEFORE contacting OMEGA:

1. Purchase Order number to cover the COST of the repair,
2. Model and serial number of the product, and
3. Repair instructions and/or specific problems relative to the product.

OMEGA's policy is to make running changes, not model changes, whenever an improvement is possible. This affords our customers the latest in technology and engineering.

[^0]:    Communication Interfaces shown above are those which are used on iLD Big Display devices. Other types of Communication Interfaces are not covered in this chapter.

[^1]:    Note ${ }^{1 s}$
    iLD Big Display devices support only Write to Single Register command

[^2]:    When a device returns an error message, it adds 80 Hex to the Function Code $(03+80=83$ or $06+80=86)$
