INTRODUCTION
This instrument is a portable easy to use 3½-digit, compact-sized digital infrared thermometer with laser sighting designed for simple one hand operation. Meter comes with Backlit LCD display, Auto-Hold function and auto power down (10 seconds approx.) after releasing Trigger to extend battery life.

SAFETY INFORMATION
It is recommended that you read the safety and operation instructions before using the infrared thermometer.

DANGER
Pressing the Trigger turns the laser beam on and off. Exercise extreme care and do not allow the laser beam to enter your eye or those of any other person or animal.

• Do not look directly into the laser light from the optical system.
• When measuring the temperature of an object which has a mirror finish, be careful not to allow the laser light beam to be reflected off the surface into your eyes or those of another person.
• Do not allow the laser light beam to impinge upon any gas which can explode.

CAUTION
• Do not use the unit near any device which generates strong electromagnetic radiation or near a static electrical charge, as these may cause errors.
• Do not use the unit where it may be exposed to corrosive or explosive gases. The unit may be damaged, or explosion may occur.
• Do not keep or use this unit in an environment where it will be directly illuminated by sunshine, or where it will be exposed to high temperatures, high humidity or condensation. If you do, it may be deformed, its insulation may be damaged, or it may no longer function according to specification.
• Do not point the lens at the sun or at any other source of strong light. If you do, the sensor may be damaged.
• Do not touch the lens against the object whose temperature is to be measured, or get it dirty, allow it to be scratched, or allow any foreign material to adhere to it. Doing so may cause errors.
• Do not touch or hold by the front case. Temperature reading can be affected by heat from hand.
• Do not place the meter on or around hot objects (70°C/158°F). It may cause damage to the case.
• Do not contact the lens against the object whose temperature is to be measured, or get it dirty, allow it to be scratched, or allow any foreign material to adhere to it. Doing so may cause errors.
• Do not allow the laser light beam to be reflected off the surface into your eyes or those of another person.

SPECIFICATIONS

GENERAL
Display: 3½ digit liquid crystal display (LCD) with maximum reading of 1999.
Low battery indication: The “<” is displayed when the battery voltage drops below the operating level.
Measurement rate: 0.25 second, nominal.
Operating Environment: 32°F to 122°F (0°C to 50°C) at <70% R.H.
Storage Temperature: -4°F to 140°F (-20°C to 60°C), 0 to 80% R.H. with battery removed from meter.
Auto power off: 10 seconds.
Standby consuming current: <5µA.
Battery: Standard 9V battery (NEDA 1604, IEC 6F22 006P).
Battery Life: 9 hours typical.
Dimensions: 148mm(H) x 105mm(W) x 42mm(D).
Weight: approx. 175g. (including battery)

Laser Specifications
Laser safety classification of Class 2.
Wave Length: Red (630~670nm).
Power out: <1mW, class 2 laser product.

OPERATING INSTRUCTIONS

Trigger
Laser and backlit function work at the same time when the power on.
Pull the trigger to turn on the meter when power off.
If the trigger released the value will be held and “HOLD” displayed.

Auto Power-Off function
It will auto power off for about 10 seconds.

Selecting the Temperature Scale
Readings are displayed in either degrees Celsius(°C) or degrees Fahrenheit(°F). When the thermometer is turned on, it is set to the temperature scale that was in use when the thermometer was last turned off. To change the temperature scale, pull off the battery cap and then slide the switch to select °C/°F.

OPERATION
1. Take the protective cap off and then pull the trigger to turn on the meter.
2. Point the lens at the object whose temperature is to be measured.
3. Pull the trigger. Measurement is performed as long as trigger is depressed.
4. Referring to the spot size figure, aim the laser beam at the object whose temperature is to be measured.
5. Put the cap on to extend life of the sensor and to avoid danger caused by wrong way to use laser.

NOTE: Although the field of measurement (or Field of View) and the spot almost coincide, actually the field of measurement corresponds to the diameter for 90% optical response. The object whose temperature is to be measured needs to be larger than the measurement diameter (spot of size) by an adequate margin at least 1.5 to 2 times larger.

ELECTRICAL
Temperature Range: -30°C to 550°C / -22°F to 1022°F.
Display Resolution: 0.5/1°C (Auto), 1°F.
Accuracy: ±(2°C/4°F) for -30°C to 100°C, -22°F to 212°F.
±(2% reading) for 101°C to 550°C, 213°F to 1022°F.

Temperature Coefficient:
±0.2% of reading or ±0.36°F/0.2°C, whichever is operating temperature above 82.4°F/28°C or below 64.4°F/18°C.

Response Time: 0.25 second.
Spectral Response: 6 to 14µm nominal.
Fixed emissivity (ε): 0.95.
Detection Element: Thermopile.
Optical Lens: Fresnel Lens.
Sighting: 1-beam laser marker <1mW (class 2).
Field of View: 100mmØ at 1000mm (3.9"Ø at 39.0”).

Display Resolution:
Display: 100mmØ at 1000mm (3.9"Ø at 39.0”).
1. Theory of Measurement

Every object emits infrared energy in accordance with its temperature. By measuring the amount of this radiant energy, it is possible to determine the temperature of the emitting object.

2. About Infrared

Infrared radiation is a form of light (electromagnetic radiation), and has the property that it passes easily through air while it is easily absorbed by solid matter. With an emission thermometer which operates by detecting infrared radiation accurate measurement is possible, irrespective of the air temperature or the measurement distance.

3. Emissivity Thermometer Structure

Infrared radiation which has been emitted from the object is focused upon an infrared radiation sensor, via an optical system. This includes a lens which is transparent to infrared radiation. And 5.3µm cut off filter. The output signal from the infrared radiation sensor is input to an electronic circuit along with the output signal from a standard temperature sensor (Thermopile).

4. Emissivity

All objects emit invisible infrared energy. The amount of energy emitted is proportional to the object's temperature and is proportional to the BR energy absorption ability, called emissivity, is based upon the material that the object is made of and its surface finish. Emissivity values range from 0.10 for a very reflective object to 1.00 for a black body. Factory set emissivity value of 0.95, which covers 90% of typical applications.

5. If the surface to be measured is covered by frost or other material, clean it to expose the surface.

6. If the surface to be measured is highly reflective, apply masking tape or matte finish paint to the surface.

7. If the meter seems to be giving incorrect readings check the front cone. There may be condensation or debris obstructing the sensor; clean proper instructions in the maintenance section.

MAINTENANCE

Battery Replacement

1. Power is supplied by a 9 volt “transistor” battery. (NEDA 1604, IEC 6F22).

2. Pull off battery cover ".

3. Remove the battery cover by gently sliding it towards the bottom of the meter.

4. Remove and disconnect the old battery from the meter and replace with a new unit. Wind the excess lead through the battery chamber.

6. If the meter seems to be giving incorrect readings check the front cone. There may be condensation or debris obstructing the sensor; clean proper instructions in the maintenance section.

5. Put on the battery cover.

6. When battery is installed, the meter turns on automatically to check the battery condition. Power will turn off automatically after 10 seconds without operation.

Cleaning

Periodically wipe the case with a damp cloth and detergent, do not use abrasives or solvents.
