1. Introduction

The OME-PIO-D96 provides 96 TTL digital I/O lines. The OME-PIO-D96 consists of four 24-bit bi-directional ports. Each 24-bit port supports three 8-bit groups PA, PB & PC. Each 8-bit group can be configured to function as either inputs or latched outputs. All groups are configured as inputs upon power-up or reset.

The OME-PIO-D96 has one D-Sub connector and three 50-pin flat cable headers. Each header can connect to a 50-pin flat cable. The flat cable can be connected to OME-ADP-37/PCI or OME-ADP-50/PCI adapter. The adapter can be fixed on the chassis. It can be installed in 5V PCI bus and supports “Plug & Play”.

1.1 Features

- PCI bus
- Up to 96 channels of digital I/O
- All I/O lines buffered on the board
- Eight-bit groups independently selectable for I/O on each 24-bit port
- Input/Output programmable I/O ports under software control
- SMD, short card, power saving
- Each board = 4 connectors = 4×3 ports = 4×3×8 bits = 96 bits
- 4 interrupt sources: P2C0, P5C0, P8C0, P11C0 (Refer to sec. 2.7)
- One D-sub connector, three 50-pin flat cable connectors
- Automatically detected by windows 95/98/NT/2000/XP
- No base address or IRQ switches to set
1.2 Specifications

- **All inputs are TTL compatible**
  Logic high voltage: 2.4V (Min.)
  Logic low voltage: 0.8V (Max.)
- **All outputs are TTL compatible**
  Sink current: 64mA (Max.)
  Source current: 32mA (Max.)
- Environmental:
  Operating Temperature: 0°C to 60°C
  Storage Temperature: -20°C to 80°C
  Humidity: 0 to 90% non-condensing
- Dimension: 180mm X 105mm
- Power Consumption: +5V @ 600mA

1.3 Order Description

- OME-PIO-D96 : PCI bus 96-bit opto-22 board

1.3.1 Options

- OME-DB-24P, OME-DB-24PD : 24 channel isolated D/I board
- OME-DB-24R, OME-DB-24RD : 24 channels relay board
- OME-DB-24PR, OME-DB-24PRD : 24 channels power relay board
- OME-DB-16P8R : 16 channels isolated D/I and 8 channels relay output board
- OME-DB-24POR : 24 channels Photo MOS output board
- OME-DB-24C : 24 channels open-collector output board
- OME-ADP-37/PCI : extender, 50 pin OPTO-22 header to DB-37 for PCI bus I/O boards
- OME-ADP-50/PCI : extender, 50 pin OPTO-22 header to 50-pin header, for PCI bus I/O boards
### 1.4 PCI Data Acquisition Family

We provide a family of PCI bus data acquisition cards. These cards can be divided into three groups as follows:

1. **OME-PCI-series: first generation, isolated or non-isolated cards**
   - OME-PCI-1002/1202/1800/1802/1602: multi-function family, non-isolated
   - OME-PCI-P16R16/P16C16/P16POR16/P8R8: D/I/O family, isolated
   - OME-PCI-TMC12: timer/counter card, non-isolated

2. **OME-PIO-series: cost-effective generation, non-isolated cards**
   - OME-PIO-823/821: multi-function family
   - OME-PIO-D144/D96/D64/D56/D48/D24: D/I/O family
   - OME-PIO-DA16/DA8/DA4: D/A family

3. **OME-PISO-series: cost-effective generation, isolated cards**
   - OME-PISO-813: A/D card
   - OME-PISO-P32C32/P32A32/P64/C64/A64: D/I/O family
   - OME-PISO-P8R8/P8SSR8AC/P8SSR8DC: D/I/O family
   - OME-PISO-730/730A: D/I/O card
   - OME-PISO-DA2: D/A card

### 1.5 Product Check List

In addition to this manual, the package includes the following items:

- one piece of OME-PIO-D96 card
- one piece of software floppy diskette or CD
- one piece of release note

It is recommended to read the release note first. All important information will be given in release note as follows:

1. Where you can find the software driver & utility?
2. How to install software & utility?
3. Where is the diagnostic program?
4. FAQ

**Attention!**

If any of these items is missing or damaged, contact Omega Engineering immediately. Save the shipping materials and the box in case you want to ship or store the product in the future.
2. Hardware configuration

2.1 Board Layout

![Board Layout Diagram]
2.2 I/O port Location

There are twelve 8-bit I/O ports in the OME-PIO-D96. Every I/O port can be programmed as D/I or D/O port. When the PC is first powered up, all twelve ports are used as D/I port. The I/O port location is given as follows:

<table>
<thead>
<tr>
<th>Connector of OME-PIO-D96</th>
<th>PA0 ~ PA7</th>
<th>PB0 ~ PB7</th>
<th>PC0 ~ PC7</th>
</tr>
</thead>
<tbody>
<tr>
<td>CN1</td>
<td>Port0</td>
<td>Port1</td>
<td>Port2</td>
</tr>
<tr>
<td>CN2</td>
<td>Port3</td>
<td>Port4</td>
<td>Port5</td>
</tr>
<tr>
<td>CN3</td>
<td>Port6</td>
<td>Port7</td>
<td>Port8</td>
</tr>
<tr>
<td>CN4</td>
<td>Port9</td>
<td>Port10</td>
<td>Port11</td>
</tr>
</tbody>
</table>

Refer to Sec. 2.1 for board layout & I/O port location.

Note: Each PC0 can be used as interrupt signal source. Refer to Sec. 2.5 for more information.

2.3 Enable I/O Operation

When the PC is powered up, all D/I/O ports are disabled. The enable/disable of D/I/O is controlled by the RESET\ signal. Refer to Sec. 3.3.1 for more information about RESET\ signal. The power-up states are given as follows:

- All D/I/O operations are disabled
- All twelve D/I/O ports are configured as D/I port
- All D/O latch register are undefined.(refer to Sec. 2.4)

The user has to perform some initialization before using these D/I/Os. These recommended steps are given as follows:

Step 1: find address-mapping of PIO/PISO cards (refer to Sec. 3.1)
Step 2: enable all D/I/O operation (refer to Sec. 3.3.1)
Step 3: configure the first three ports to their expected D/I/O state & send the initial value to all D/O ports (refer to Sec. 3.3.7)
Step 4: configure the other three ports to their expected D/I/O state & send the initial value to all D/O ports(refer to Sec. 3.3.7)

Refer to DEMO1.C for demo program.
2.4 D/I/O Architecture

- The RESET\ is in Low-state → all D/I/O are disabled
- The RESET\ is in High-state → all D/I/O are enabled
- If D/I/O is configured as D/I port → D/I= external input signal
- If D/I/O is configured as D/O port → D/I = read back D/O
- If D/I/O is configured as D/I port → send to D/O will change the D/O latch register only. The D/I & external input signal will not change

2.5 Interrupt Operation

All P2C0, P5C0, P8C0 and P11C0 can be used as interrupt signal sources. Refer to Sec. 2.1 & Sec. 2.7 for P2C0/P5C0/P8C0/P11C0 location. The interrupt of OME-PIO-D96 is **level-trigger & Active_High**. The interrupt signal can be **inverted** or **non-inverted** programmable. The procedures of programming are given as follows:

1. make sure the **initial level is High or Low**
2. if the initial state is High → select the **inverted** signal (Sec. 3.3.6)
3. if the initial state is Low → select the **non-inverted** signal (Sec. 3.3.6)
4. enable the INT function (Sec. 3.3.4)
5. If the interrupt signal is active → program will transfer into the interrupt service routine → if INT signal is High now → select the inverted input
   → if INT signal is Low now → select the non-inverted input

If only one interrupt signal source is used, the interrupt service routine does not have to identify the interrupt source. (Refer to DEMO3.C & DEMO4.C)

If there are more than one interrupt sources, the interrupt service routine has to identify the active signals as follows: (Refer to DEMO5.C)

1. Read the new status of the interrupt signal source
2. Compare the new status with the old status to identify the active signals
3. If P2C0 is active, service P2C0 & non-inverter/inverted the P2C0 signal
4. If P5C0 is active, service P5C0 & non-inverted/inverted the P5C0 signal
5. If P8C0 is active, service P8C0 & non-inverted/inverted the P8C0 signal
6. If P11C0 is active, service P11C0 & non-inverted/inverted the P11C0 signal
7. Save the new status to old status

**Note:** If the interrupt signal is too short, the new status may be as same as old status. So the interrupt signal must be hold-active until the interrupt service routine is executed. This hold time is different for different operating systems. The hold time can be as short as micro-second or as long as second. In general, 20ms is enough for most operating systems.
2.5.1 Interrupt Block Diagram of OME-PIO-D96

The interrupt output signal of OME-PIO-D96, INT\, is Level_trigger & Active.Low. If the INT\ generate a low-pulse, the OME-PIO-D96 will interrupt the PC only once. If the INT\ is fixed in low level, the OME-PIO-D96 will interrupt the PC continuously. So that INT_CHAN_0/1/2/3 must be controlled in a pulse type signals. They must be fixed in low level state normally and generated a high_pulse to interrupt the PC.

The priority of INT_CHAN_0/1/2/3 is the same. If all these four signals are active at the same time, then INT\ will be active only once a time. So the interrupt service routine has to read the status of all interrupt channels for multi-channel interrupt. Refer to Sec. 2.5 for more information.

DEMO5.C → for multi-channel interrupt source

If only one interrupt source is used, the interrupt service routine doesn’t have to read the status of interrupt source. The demo programs, DEMO3.C & DEMO4.C are designed for single-channel interrupt demo as follows:

DEMO3.C → for INT_CHAN_0 only (P2C0 initial low)
DEMO4.C → for INT_CHAN_0 only (P2C0 initial high)
2.5.2 INT_CHAN_0/1/2/3

The INT_CHAN_0(1/2/3) must be fixed in low level state normally and generated a high_pulse to interrupt the PC.

The EN0 (EN1/EN2/EN3) can be used to enable/disable the INT_CHAN_0(1/2/3) as follows: (Refer to Sec. 3.3.4)

EN0 (1/2/3) = 0 → INT_CHAN_0(1/2/3) = disable
EN0 (1/2/3) = 1 → INT_CHAN_0(1/2/3) = enable

The INV0 can be used to invert/non-invert the PC0 (1/2/3) as follows: (Refer to Sec.3.3.6)

INV0 (1/2/3) = 0 → INT_CHAN_0(1/2/3) = inverted state of P2C0

(INV0 (1/2/3) = 0 → INT_CHAN_0(1/2/3) = inverted state of P2C0
(P5C0/P8C0/P11C0)

INV0 (1/2/3) = 1 → INT_CHAN_0(1/2/3) = non-inverted state of P2C0

(INV0 (1/2/3) = 1 → INT_CHAN_0(1/2/3) = non-inverted state of P2C0
(P5C0/P8C0/P11C0)
2.5.3 Initial_high, active_low Interrupt source

If the P2C0 is an initial_high, active_low signal, the interrupt service routine should use INV0 to invert or not to invert the P2C0 for high_pulse generation as follows: (Refer to DEMO4.C)

Initial set:

```c
now_int_state=1; /* initial state for P2C0 */
outportb(wBase+0x2a,0); /* select the inverted P2C0 */
```

```c
void interrupt irq_service()
{
    if (now_int_state==1) /* now P2C0 is changed to LOW */
    {
        COUNT_L++; /* find a LOW_pulse (P2C0) */
        if((inport(wBase+7)&1)==0) /* the P2C0 is still fixed in LOW */
        {
            /* need to generate a high_pulse */
            outportb(wBase+0x2a,1); /* INV0 select the non-inverted input */
            /* INT_CHAN_0=P2C0=LOW --> INT_CHAN 0 generate a high_pulse */
            now_int_state=0; /* now P2C0=LOW */
        }
        else now_int_state=1; /* now P2C0=HIGH */
        /* don’t have to generate high_pulse */
    }  
    else /* now P2C0 is changed to HIGH */
    {
        COUNT_H++; /* find a HIGH_pulse (P2C0) */
        if((inport(wBase+7)&1)==1) /* the P2C0 is still fixed in HIGH */
        {
            /* need to generate a high_pulse */
            outportb(wBase+0x2a,0); /* INV0 select the inverted input */
            /* INT_CHAN_0=!P2C0=LOW --> INT_CHAN 0 generate a high_pulse */
            now_int_state=1; /* now P2C0=HIGH */
        }
        else now_int_state=0; /* now P2C0=LOW */
        /* don’t have to generate high_pulse */
    }
    if (wIrq>=8) outportb(A2_8259,0x20);
    outportb(A1_8259,0x20);
}
```

OME-PIO-D96 User Manual (Ver.1.1, Mar/2003)  ----  12
2.5.4 Initial_low, active_high Interrupt source

If the P2C0 is an initial_low, active_high signal, the interrupt service routine should use INV0 to invert or not to invert the P2C0 for high_pulse generation as follows: (Refer to DEMO3.C)

Initial set:

```c
now_int_state=0;               /* initial state for P2C0              */
outportb(wBase+0x2a,1);  /* select the non-inverted P2C0 */
```

```c
void interrupt irq_service() {
    if (now_int_state==1)       /* now P2C0 is changed to LOW         */(c)
        {                        /* --> INT_CHAN_0=!P2C0=HIGH now      */
            COUNT_L++;               /* find a LOW_pulse (P2C0) */
            if((inport(wBase+7)&1)==0)/* the P2C0 is still fixed in LOW    */
                {                      /* need to generate a high_pulse   */
                    outportb(wBase+0x2a,1);/* INV0 select the non-inverted input */(d)
                    /* INT_CHAN_0=P2C0=LOW -->            */
                    /* INT_CHAN_0 generate a high_pulse  */
                    now_int_state=0;       /* now P2C0=LOW                       */
                }
            else now_int_state=1;    /* now P2C0=HIGH                      */(a)
                /* don’t have to generate high_pulse */
            }
        else                        /* now P2C0 is changed to HIGH        */(a)
            {                        /* --> INT_CHAN_0=P2C0=HIGH now       */
                COUNT_H++;               /* find a High_pulse (P2C0) */
                if((inport(wBase+7)&1)==1)/* the P2C0 is still fixed in HIGH   */
                    {                      /* need to generate a high_pulse      */
                        outportb(wBase+0x2a,0);/* INV0 select the inverted input    */(b)
                        /* INT_CHAN_0=!P2C0=LOW -->            */
                        /* INT_CHAN_0 generate a high_pulse  */
                        now_int_state=1;       /* now P2C0=HIGH                       */
                    }
                else now_int_state=0;    /* now P2C0=LOW                      */(a)
                    /* don’t have to generate high_pulse */
            }
    else                           /* now P2C0 is changed to LOW         */(c)
        {                        /* --> INT_CHAN_0=!P2C0=HIGH now      */
            COUNT_L++;               /* find a LOW_pulse (P2C0) */
            if((inport(wBase+7)&1)==0)/* the P2C0 is still fixed in LOW    */
                {                      /* need to generate a high_pulse   */
                    outportb(wBase+0x2a,1);/* INV0 select the non-inverted input */(d)
                    /* INT_CHAN_0=P2C0=LOW -->            */
                    /* INT_CHAN_0 generate a high_pulse  */
                    now_int_state=0;       /* now P2C0=LOW                       */

2.5.5 Multi Interrupt Source

Assume: P2C0 is initial Low, active High,
P5C0 is initial High, active Low
P8C0 is initial Low, active High
P11C0 is initial High, active Low

as follows:

Refer to DEMO5.C for the source. All these four falling edges & rising edges can be detected by DEMO5.C.

Note: When the interrupt is active, the user program has to identify the active signals. Multiple signals maybe active simultaneously. So the interrupt service routine has to service all active signals at the same time.
void interrupt irq_service()
{
  new_int_state=inportb(wBase+7)&0x0f;  /* read all interrupt state */
  int_c=new_int_state^now_int_state;    /* compare which interrupt */
                            /* signal be change */
  if ((int_c&0x1)!=0)                   /* INT_CHAN_0 is active */
  {                                   /* now P2C0 change to high */

  outportb(A1_8259,0x20);
}
2.6 Daughter Boards

2.6.1 OME-DB-37
The OME-DB-37 is a general purpose daughter board for D-sub 37 pins. It is designed for easy wire connection.

2.6.2 OME-DN-37 & OME-DN-50
The OME-DN-37 is a general purpose daughter board for D-sub 37-pin connector. The OME-DN-50 is designed for 50-pin flat-cable header. They are designed for easy wiring. Both are DIN rail mountable.

2.6.3 OME-DB-8125
The OME-DB-8125 is a general purpose screw terminal board. It is designed for easy wiring. There is one D-sub 37-pin connector & two 20-pin flat-cable headers in the OME-DB-8125.
2.6.4 OME-ADP-37/PCI & OME-ADP-50/PCI

The OME-ADP-37/PCI & OME-ADP-50/PCI are extenders for 50-pin headers. One side of OME-ADP-37/PCI & OME-ADP-50/PCI can be connected to a 50-pin header. The other side can be mounted on the PC chassis as follows:

OME-ADP-37/PCI: 50-pin header to D-sub 37 extender.
OME-ADP-50/PCI: 50-pin header to 50-pin header extender.

NOTE: The user has to choose the suitable extender for their boards.
2.6.5 OME-DB-24P/24PD Isolated Input Board

The OME-DB-24P is a 24 channel isolated digital input daughter board. The optically isolated inputs of the OME-DB-24P, consists of a bi-directional opto-coupler with a resistor for current sensing. You can use the OME-DB-24P to sense DC signal from TTL levels up to 24V or use the OME-DB-24P to sense a wide range of AC signals. You can use this board to isolate the computer from large common-mode voltage, ground loops and transient voltage spikes that often occur in industrial environments.

2.6.6 OME-DB-24R/24RD Relay Board

The OME-DB-24R, 24 channel relay output board, consists of 24 form C relays for efficient switch of load by programmed control. The relays are energized by apply 12V/24V signal to the appropriated relay channel on the 50-pin flat connector. There are 24 enunciator LEDs for each relay and they light when their associated relay is activated.

</tbody>
</table>
The OME-DB-24PR, 24 channel power relay output board, consists of 8 form C and 16 form A electromechanical relays for efficient switching of load by programmed control. The contact of each relay can control a 5A load at 250VAC/30VDC. The relay is energized by applying a 5 volt signal to the appropriate relay channel on the 20-pin flat cable connector (only 16 relays) or 50-pin flat cable connector (compatible for OME-DIO-24 series). Twenty-four enunciator LEDs, one for each relay, light when their associated relay is activated. To avoid overloading your PC’s power supply, this board needs a +12VDC or +24VDC external power supply.

</table>

All signals are TTL compatible.
3. I/O Control Register

3.1 How to Find the I/O Address

The plug & play BIOS will assign a proper I/O address to every OME-PIO/PISO series card in the power-up stage. The IDs of OME-PIO-D96 cards are given as follows:

<table>
<thead>
<tr>
<th>Vendor ID</th>
<th>Device ID</th>
<th>Sub-vendor ID</th>
<th>Sub-device ID</th>
<th>Sub-aux ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>0xE159</td>
<td>0x0002</td>
<td>0x80</td>
<td>0x01</td>
<td>0x10</td>
</tr>
</tbody>
</table>

We provide all necessary functions as follows:

1. PIO_DriverInit(&wBoard, wSubVendor, wSubDevice, wSubAux)
2. PIO_GetConfigAddressSpace(wBoardNo,*wBase,*wIrq, *wSubVendor,*wSubDevice, *wSubAux, *wSlotBus, *wSlotDevice)
3. Show_PIO_PISO(wSubVendor, wSubDevice, wSubAux)

All functions are defined in PIO.H. Refer to Chapter 4 for more information. The important driver information is given as follows:

1. Resource-allocated information:
   - wBase : BASE address mapping in this PC
   - wIrq: IRQ channel number allocated in this PC

2. OME-PIO/PISO identification information:
   - wSubVendor: subVendor ID of this board
   - wSubDevice: subDevice ID of this board
   - wSubAux: subAux ID of this board

3. PC’s physical slot information:
   - wSlotBus: hardware slot ID1 in this PC’s slot position
   - wSlotDevice: hardware slot ID2 in this PC’s slot position

The utility program, PIO_PISO.EXE, will detect & show all OME-PIO/PISO cards installed in this PC. Refer to Sec. 4.1 for more information.
3.1.1 PIO_DriverInit

PIO_DriverInit(&wBoards, wSubVendor,wSubDevice,wSubAux)

- wBoards=0 to N → number of boards found in this PC
- wSubVendor → subVendor ID of board to find
- wSubDevice → subDevice ID of board to find
- wSubAux → subAux ID of board to find

This function can detect all OME-PIO/PISO series card in the system. It is implemented based on the PCI plug & play mechanism. It will find all OME-PIO/PISO series cards installed in this system & save all their resources in the library.

Sample program 1: find all OME-PIO-D96 installed in the PC

```c
wSubVendor=0x80; wSubDevice=1; wSubAux=0x10; /* for PIO_D96 */
wRetVal=PIO_DriverInit(&wBoards, wSubVendor,wSubDevice,wSubAux);
printf("There are %d OME-PIO-D96 Cards in this PC\n",wBoards);

/* step2: save resource of all OME-PIO-D96 cards installed in this PC */
for (i=0; i<wBoards; i++)
{
    PIO_GetConfigAddressSpace(i,&wBase,&wIrq,&wID1,&wID2,&wID3,
    &wID4,&wID5);
    printf("Card_%d: wBase=%x, wIrq=%x", i,wBase,wIrq);
    wConfigSpace[i][0]=wBaseAddress; /* save all resource of this card */
    wConfigSpace[i][1]=wIrq; /* save all resource of this card */
}
```

Sample program 2: find all OME-PIO/PISO installed in the PC (refer to Sec. 4.1 for more information)

```c
wRetVal=PIO_DriverInit(&wBoards,0xff,0xff,0xff); /*find all PIO_PISO*/
printf("There are %d PIO_PISO Cards in this PC",wBoards);
if (wBoards==0 ) exit(0);
printf("-----------------------------------------------------
for(i=0; i<wBoards; i++)
{
    PIO_GetConfigAddressSpace(i,&wBase,&wIrq,&wSubVendor,
    &wSubDevice,&wSubAux,&wSlotBus,&wSlotDevice);
    printf("\nCard %d:wBase=%x, wIrq=%x, subID=[%x,%x,%x],
           SlotID=[%x,%x]",i,wBase,wIrq,wSubVendor,wSubDevice,
           wSubAux,wSlotBus,wSlotDevice);
    printf(" --> ");
    ShowPioPiso(wSubVendor,wSubDevice,wSubAux);
}
```
The Sub IDs of OME-PIO/PISO series card are given as follows:

</tbody>
</table>

Note: If your board is a different version, it may also have different Sub IDs. However this will present no actual problem. No matter which version of the board you select, we offer the same function calls.
3.1.2 PIO_GetConfigAddressSpace

PIO_GetConfigAddressSpace(wBoardNo,*wBase,*wIrq, *wSubVendor,
                          *wSubDevice,*wSubAux,*wSlotBus, *wSlotDevice)

- wBoardNo=0 to N \( \rightarrow \) totally N+1 boards found by PIO_DriveInit(…)
- wBase \( \rightarrow \) base address of the board control word
- wIrq \( \rightarrow \) allocated IRQ channel number of this board
- wSubVendor \( \rightarrow \) subVendor ID of this board
- wSubDevice \( \rightarrow \) subDevice ID of this board
- wSubAux \( \rightarrow \) subAux ID of this board
- wSlotBus \( \rightarrow \) hardware slot ID1 of this board
- wSlotDevice \( \rightarrow \) hardware slot ID2 of this board

The user can use this function to save resources of all OME-PIO/PISO cards installed in this system. Then the application program can control all functions of OME-PIO/PISO series card directly.

The sample program source is given as follows:

```c
/* step1: detect all OME-PIO-D96 cards first */
wSubVendor=0x80; wSubDevice=1; wSubAux=0x10; /* for PIO_D96 */
wRetVal=PIO_DriverInit(&wBoards, wSubVendor,wSubDevice,wSubAux);
printf("There are %d OME-PIO-D96 Cards in this PC\n",wBoards);

/* step2: save resource of all OME-PIO-D96 cards installed in this PC */
for (i=0; i<wBoards; i++)
{
    PIO_GetConfigAddressSpace(i,&wBase,&wIrq,&t1,&t2,&t3,&t4,&t5);
    printf("Card_%d: wBase=%x, wIrq=%x", i,wBase,wIrq);
    wConfigSpace[i][0]=wBaseAddress; /* save all resource of this card */
    wConfigSpace[i][1]=wIrq; /* save all resource of this card */
}

/* step3: control the OME-PIO-D96 directly */
wBase=wConfigSpace[0][0];/* get base address the card_0 */
outport(wBase,1); /* enable all D/I/O operation of card_0 */

wBase=wConfigSpace[1][0];/* get base address the card_1 */
outport(wBase,1); /* enable all D/I/O operation of card_1 */
```

OME-PIO-D96 User Manual (Ver.1.1, Mar/2003)    ----  27
3.1.3 ShowPIO_PISO

ShowPIO_PISO(wSubVendor, wSubDevice, wSubAux)

- wSubVendor \( \rightarrow \) subVendor ID of board to find
- wSubDevice \( \rightarrow \) subDevice ID of board to find
- wSubAux \( \rightarrow \) subAux ID of board to find

This function will output a text string for these special subIDs. This text string is the same as that defined in PIO.H

The demo program is given as follows:

```c
wRetVal=PIO_DriverInit(&wBoards,0xff,0xff,0xff); /*find all PIO_PISO*/
printf("\nThrer are %d PIO_PISO Cards in this PC",wBoards);
if (wBoards==0 ) exit(0);

printf("\n-----------------------------------------------
for(i=0; i<wBoards; i++)
{
    PIO_GetConfigAddressSpace(i,&wBase,&wIrq,&wSubVendor,
        &wSubDevice,&wSubAux,&wSlotBus,&wSlotDevice);
    printf("\nCard_%d:wBase=%x,wIrq=%x,subID=[%x,%x,%x],
        SlotID=[%x,%x]",i,wBase,wIrq,wSubVendor,wSubDevice,
            wSubAux,wSlotBus,wSlotDevice);
    printf(" --> ");
    ShowPioPiso(wSubVendor,wSubDevice,wSubAux);
}
```

```
### 3.2 The Assignment of I/O Address

The plug & play BIOS will assign the proper I/O address to PIO/PISO series card. If there is only one PIO/PISO board, the user can identify the board as card_0. If there are two PIO/PISO boards in the system, the user will be very difficult to identify which board is card_0? The software driver can support 16 boards max. Therefore the user can install 16 boards of PIO/PSIO series in one PC system. How to find the card_0 & card_1?

**The simplest way to identify which card is card_0 is to use wSlotBus & wSlotDevice as follows:**

1. Remove all OME-PIO-D96 from the PC
2. Install one OME-PIO-D96 into the PC’s PCI_slot1, run PIO_PISO.EXE & record the wSlotBus1 & wSlotDevice1
3. Remove all OME-PIO-D96 from the PC
4. Install one OME-PIO-D96 into the PC’s PCI_slot2, run PIO_PISO.EXE & record the wSlotBus2 & wSlotDevice2
5. Repeat (3) & (4) for all PCI_slot?, record all wSlotBus? & wSlotDevice?

The records may be as follows:

<table>
<thead>
<tr>
<th>PC’s PCI slot</th>
<th>wSlotBus</th>
<th>wSlotDevice</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slot_1</td>
<td>0</td>
<td>0x07</td>
</tr>
<tr>
<td>Slot_2</td>
<td>0</td>
<td>0x08</td>
</tr>
<tr>
<td>Slot_3</td>
<td>0</td>
<td>0x09</td>
</tr>
<tr>
<td>Slot_4</td>
<td>0</td>
<td>0x0A</td>
</tr>
<tr>
<td>PCI-BRIDGE</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Slot_5</td>
<td>1</td>
<td>0x0A</td>
</tr>
<tr>
<td>Slot_6</td>
<td>1</td>
<td>0x08</td>
</tr>
<tr>
<td>Slot_7</td>
<td>1</td>
<td>0x09</td>
</tr>
<tr>
<td>Slot_8</td>
<td>1</td>
<td>0x07</td>
</tr>
</tbody>
</table>

The above procedure will record all wSlotBus? & wSlotDevice? in the PC. These values will be mapped to this PC’s physical slot. This mapping will not be changed for any OME-PIO/PISO cards. So it can be used to identify the specified OME-PIO/PISO card as follows:

**Step 1: Record all wSlotBus? & wSlotDevice?**

**Step2: Use PIO_GetConfigAddressSpace(…) to get the specified card’s wSlotBus & wSlotDevice**

**Step3: The user can identify the specified OME-PIO/PISO card if they compare the wSlotBus & wSlotDevice in step2 to step1.**
### 3.3 The I/O Address Map

The I/O address of OME-PIO/PISO series card is automatically assigned by the main board ROM BIOS. The I/O address can also be reassigned by user. **It is strongly recommended not to change the I/O address by user. The plug & play BIOS will assign proper I/O address to each OME-PIO/PISO series card very well.** The I/O addresses of OME-PIO-D96 are given as follows:

<table>
<thead>
<tr>
<th>Address</th>
<th>Read</th>
<th>Write</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wbase+0</td>
<td>RESET\x control register</td>
<td>Same</td>
</tr>
<tr>
<td>Wbase+2</td>
<td>Aux control register</td>

<td>Port9~Port11 configuration</td>
</tr>
</tbody>
</table>

**Note.** Refer to Sec. 3.1 for more information about wBase.
### 3.3.1 RESET\ Control Register

(Read/Write): wBase+0

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved</td>
<td>Reserved</td>
<td>Reserved</td>
<td>Reserved</td>
<td>Reserved</td>
<td>Reserved</td>
<td>Reserved</td>
<td>RESET\</td>
</tr>
</tbody>
</table>

**Note.** Refer to Sec. 3.1 for more information about wBase.

When the PC is first power-on, the RESET\ signal is in Low-state. **This will disable all D/I/O operations.** The user has to set the RESET\ signal to High-state before any D/I/O command.

```c
outportb(wBase,1); /* RESET\=High \rightarrow all D/I/O are enable now */

outportb(wBase,0); /* RESET\=Low \rightarrow all D/I/O are disable now */
```

### 3.3.2 AUX Control Register

(Read/Write): wBase+2

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aux7</td>
<td>Aux6</td>
<td>Aux5</td>
<td>Aux4</td>
<td>Aux3</td>
<td>Aux2</td>
<td>Aux1</td>
<td>Aux0</td>
</tr>
</tbody>
</table>

**Note.** Refer to Sec. 3.1 for more information about wBase.

Aux?=0 \rightarrow this Aux is used as a D/I
Aux?=1 \rightarrow this Aux is used as a D/O

When the PC is first power-up, All Aux? signal are in Low-state. All Aux? are designed as D/I for all PIO/PISO series. Please set all Aux? in D/I state.

### 3.3.3 AUX data Register

(Read/Write): wBase+3

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aux7</td>
<td>Aux6</td>
<td>Aux5</td>
<td>Aux4</td>
<td>Aux3</td>
<td>Aux2</td>
<td>Aux1</td>
<td>Aux0</td>
</tr>
</tbody>
</table>

**Note.** Refer to Sec. 3.1 for more information about wBase.

When the Aux? is used as D/O, the output state is controlled by this register. This register is designed for feature extension, so don’t control this register now.
### 3.3.4 INT Mask Control Register

(Read/Write): wBase+5

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>EN3</td>
<td>EN2</td>
<td>EN1</td>
<td>EN0</td>
</tr>
</tbody>
</table>

**Note.** Refer to Sec. 3.1 for more information about wBase.

EN0=0 → disable P2C0 as a interrupt signal (default)

EN0=1 → enable P2C0 as a interrupt signal

```c
outportb(wBase+5,0); /* disable interrupt */
outportb(wBase+5,1); /* enable interrupt P2C0 */
outportb(wBase+5,0x0f); /* enable interrupt P2C0, P5C0, P8C0, P11C0 */
```

### 3.3.5 Aux Status Register

(Read/Write): wBase+7

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aux7</td>
<td>Aux6</td>
<td>Aux5</td>
<td>Aux4</td>
<td>Aux3</td>
<td>Aux2</td>
<td>Aux1</td>
<td>Aux0</td>
</tr>
</tbody>
</table>

**Note.** Refer to Sec. 3.1 for more information about wBase.

Aux0=P2C0, Aux1=P5C0, Aux2=P8C0, Aux3=P11C0, Aux7~4=Aux-ID. Refer to DEMO5.C for more information. The Aux 0~3 are used as interrupt source. The interrupt service routine has to read this register for interrupt source identification. Refer to Sec. 2.5 for more information.
3.3.6 Interrupt Polarity Control Register

(Read/Write): wBase+0x2A

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>INV3</td>
<td>INV2</td>
<td>INV1</td>
<td>INV0</td>
</tr>
</tbody>
</table>

Note. Refer to Sec. 3.1 for more information about wBase.

INV0=1 → select the non-inverted signal from P2C0
INV0=0 → select the inverted signal from P2C0

outportb(wBase+0x2a,0x0f); /* select the non-inverted input P2/5/8/11C0 */
outportb(wBase+0x2a,0x00); /* select the inverted input of P2/5/8/11C0 */

outportb(wBase+0x2a,0x0e); /* select the inverted input of P2C0 */
/* select the non-inverted input P5/8/11C0 */

outportb(wBase+0x2a,0x0c); /* select the inverted input of P2/5C0 */
/* select the non-inverted input P8/11C0 */

Refer to Sec. 2.5 for more information.
Refer to DEMO5.C for more information.
### 3.3.7 I/O Selection Control Register

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>Port2</td>
<td>Port1</td>
<td>Port0</td>
</tr>
</tbody>
</table>

(Write): wBase+0xdc

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>Port5</td>
<td>Port4</td>
<td>Port3</td>
</tr>
</tbody>
</table>

(Write): wBase+0xec

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>Port8</td>
<td>Port7</td>
<td>Port6</td>
</tr>
</tbody>
</table>

(Write): wBase+0xfc

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>Port11</td>
<td>Port10</td>
<td>Port9</td>
</tr>
</tbody>
</table>

**Note.** Refer to Sec. 3.1 for more information about wBase.

Before using these D/I/O ports, user has to configure the state of ports as desired.

- port?=1 → this port is used as a D/O port
- port?=0 → this port is used as a D/I port

```c
outportb(wBase+0xcc,0x03);  /* set port0 as D/O ports */
outportb(wBase+0xdc,0x07);  /* set port1 as D/O ports */
outportb(wBase+0xec,0x00);  /* set port2 as D/I ports */
outportb(wBase+0xdc,0x07);  /* set port3 ~ port5 as D/O ports */
outportb(wBase+0xec,0x00);  /* set port6 ~ port8 as D/I ports */
```
### 3.3.8 Read/Write 8-bit data Register

(Read/Write): wBase+0xc0/0xc4/0xc8/0xfd0/0xfd4/0xfd8/
0xe0/0xe4/0xe8/0xf0/0xf4/0xf8/

<table>
<thead>
<tr>
<th>Bit 7</th>
<th>Bit 6</th>
<th>Bit 5</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>D7</td>
<td>D6</td>
<td>D5</td>
<td>D4</td>
<td>D3</td>
<td>D2</td>
<td>D1</td>
<td>D0</td>
</tr>
</tbody>
</table>

**Note.** Refer to Sec. 3.1 for more information about wBase.

There are twelve 8-bit I/O port in the OME-PIO-D96. Every I/O port can be programmed as D/I or D/O port. Refer to Sec. 3.3.8 for D/I or D/O selection. When the PC is power-up, all twelve ports are used as D/I port.

```c
outportb(wBase+0xc0,Val); /* write to Port0 */
Val=inportb(wBase+0xc0);  /* read from Port0 */
outportb(wBase+0xcc,0x07); /* set port0~port2 as D/O ports */
outportb(wBase+0xc0,i1);  /* write to Port0 */
outportb(wBase+0xc4,i2);  /* write to Port1 */
outportb(wBase+0xc8,i3);  /* write to Port2 */
outportb(wBase+0xec,0x06); /* set Port6 & Port7 as D/I ports */
/* set Port8 as D/O port */
j1=inportb(wBase+0xe0);   /* read Port6 */
j2=inportb(wBase+0xe4);   /* read Port7 */
outportb(wBase+0xe8,j3);  /* write to Port8 */
```

**NOTE:** Make sure the I/O port configuration (DI or DO) before performing read/write to the data register. (Refer to sec. 3.3.7)
4. Demo program

It is recommended to read the release note first. All important information will be given in release note as follows:

1. Where you can find the software driver & utility?
2. How to install software & utility?
3. Where is the diagnostic program?
4. FAQ

The demo programs are provided on the software floppy disk or CD. After the software installation, the driver will be installed into disk as follows:

- \TC\*.*
  → for Turbo C 2.xx or above
- \MSC\*.*
  → for MSC 5.xx or above
- \BC\*.*
  → for BC 3.xx or above
- \TC\LIB\*.*
  → for TC library
- \TC\DEMO\*.*
  → for TC demo program
- \TC\LIB\Large\*.*
  → TC large model library
- \TC\LIB\Huge\*.*
  → TC huge model library
- \TC\LIB\Large\PIO.H
  → TC declaration file
- \TC\LIB\Large\TCPIO_L.LIB
  → TC large model library file
- \TC\LIB\Huge\PIO.H
  → TC declaration file
- \TC\LIB\Huge\TCPIO_H.LIB
  → TC huge model library file
- \MSC\LIB\Large\PIO.H
  → MSC declaration file
- \MSC\LIB\Large\MSCPIO_L.LIB
  → MSC large model library file
- \MSC\LIB\Huge\PIO.H
  → MSC declaration file
- \MSC\LIB\Huge\MSCPIO_H.LIB
  → MSC huge model library file
- \BC\LIB\Large\PIO.H
  → BC declaration file
- \BC\LIB\Large\BCPIO_L.LIB
  → BC large model library file
- \BC\LIB\Huge\PIO.H
  → BC declaration file
- \BC\LIB\Huge\BCPIO_H.LIB
  → BC huge model library file

NOTE: The library is validated for all OME-PIO/PISO series cards.
### 4.1 PIO_PISO

```c
/* Find all PIO_PISO series cards in this PC system */
/* step 1: plug all PIO_PISO cards into PC */
/* step 2: run PIO_PISO.EXE */
/* ------------------------------------------------------------ */

#include "PIO.H"

WORD wBase,wIrq;
WORD wBase2,wIrq2;

int main()
{
    int i,j,j1,j2,j3,j4,k,jj,d1,d2,d3,d4;
    WORD wBoards,wRetVal;
    WORD wSubVendor,wSubDevice,wSubAux,wSlotBus,wSlotDevice;
    char c;
    float ok,err;
    clrscr();
    wRetVal=PIO_DriverInit(&wBoards,0xff,0xff,0xff);  /*for PIO-PISO*/
    printf("Thrre are %d PIO_PISO Cards in this PC",wBoards);
    if (wBoards==0 ) exit(0);

    printf("n-------------------------------");
    for(i=0; i<wBoards; i++)
    {
        PIO_GetConfigAddressSpace(i,&wBase,&wIrq,&wSubVendor,
                                   &wSubDevice,&wSubAux,&wSlotBus,&wSlotDevice);
        printf("Card_%d:wBase=%x,wIrq=%x,subID=[%x,%x,%x],
               SlotID=[%x,%x]",i,wBase,wIrq,wSubVendor,wSubDevice,
               wSubAux,wSlotBus,wSlotDevice);
        printf(" --> ");
        ShowPioPiso(wSubVendor,wSubDevice,wSubAux);
    }

    PIO_DriverClose();
}
```

**NOTE**: the PIO_PISO.EXE is valid for all PIO/PISO cards. The user can execute the PIO_PISO.EXE to get the following information:

- List all PIO/PISO cards installed in this PC
- List all resources allocated to every PIO/PISO cards
- List the wSlotBus & wSlotDevice for specified PIO/PISO card identification.
  (Refer to Sec. 3.2 for more information)
4.1.1 PIO_PISO.EXE for Windows

User can find this utility in the software CD or floppy disk. It is useful for all OME-PIO/PISO series cards.

After executing the utility, detailed information for all OME-PIO/PISO cards that are installed in the PC will be shown as follows:
4.2 DEMO1

/* demo 1 : D/O demo of CN1 */
/* step 1 : connect a OME-DB-24C to CN1 of OME-PIO-D96 */
/* step 2 : run DEMO1.EXE */
/* step 3 : check the LEDs of OME-DB-24C will turn on sequentially */

#include "PIO.H"

WORD wBase,wIrq;

main()
{
    int i1,i2,i3;
    long i=1;
    WORD wBoards,wRetVal,t1,t2,t3,t4,t5,t6;
    WORD wSubVendor,wSubDevice,wSubAux,wSlotBus,wSlotDevice;
    char c;

clear();

    /* step1 : find address-mapping of PIO/PISO cards */
    wRetVal=PIO_DriverInit(&wBoards,0x80,0x01,0x10); /* for OME-PIO-D96 */
    printf("\n(1) There are %d OME-PIO-D96 Cards in this PC",wBoards);
    if ( wBoards==0 ) exit(0);

    printf("\n\n--------- The Configuration Space ---------\n");
    for(i=0;i<wBoards;i++)
    {

WARRANTY/DISCLAIMER

OMEGA ENGINEERING, INC. warrants this unit to be free of defects in materials and workmanship for a period of 13 months from date of purchase. OMEGA's WARRANTY adds an additional one (1) month grace period to the normal one (1) year product warranty to cover handling and shipping time. This ensures that OMEGA's customers receive maximum coverage on each product.

If the unit malfunctions, it must be returned to the factory for evaluation. OMEGA's Customer Service Department will issue an Authorized Return (AR) number immediately upon phone or written request. Upon examination by OMEGA, if the unit is found to be defective, it will be repaired or replaced at no charge. OMEGA's WARRANTY does not apply to defects resulting from any action of the purchaser, including but not limited to mishandling, improper interfacing, operation outside of design limits, improper repair, or unauthorized modification. This WARRANTY is VOID if the unit shows evidence of having been tampered with or shows evidence of having been damaged as a result of excessive corrosion; or current, heat, moisture or vibration; improper specification; misapplication; misuse or other operating conditions outside of OMEGA's control. Components which wear are not warranted, including but not limited to contact points, fuses, and triacs.

OMEGA is pleased to offer suggestions on the use of its various products. However, OMEGA neither assumes responsibility for any omissions or errors nor assumes liability for any damages that result from the use of its products in accordance with information provided by OMEGA, either verbal or written. OMEGA warrants only that the parts manufactured by it will be as specified and free of defects. OMEGA MAKES NO OTHER WARRANTIES OR REPRESENTATIONS OF ANY KIND WHATSOEVER, EXPRESS OR IMPLIED, EXCEPT THAT OF TITLE, AND ALL IMPLIED WARRANTIES INCLUDING ANY WARRANTY OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE HEREBY DISCLAIMED. LIMITATION OF LIABILITY: The remedies of purchaser set forth herein are exclusive, and the total liability of OMEGA with respect to this order, whether based on contract, warranty, negligence, indemnification, strict liability or otherwise, shall not exceed the purchase price of the component upon which liability is based. In no event shall OMEGA be liable for consequential, incidental or special damages.

CONDITIONS: Equipment sold by OMEGA is not intended to be used, nor shall it be used: (1) as a “Basic Component” under 10 CFR 21 (NRC), used in or with any nuclear installation or activity; or (2) in medical applications or used on humans. Should any Product(s) be used in or with any nuclear installation or activity, medical application, used on humans, or misused in any way, OMEGA assumes no responsibility as set forth in our basic WARRANTY/DISCLAIMER language, and, additionally, purchaser will indemnify OMEGA and hold OMEGA harmless from any liability or damage whatsoever arising out of the use of the Product(s) in such a manner.

RETURN REQUESTS/INQUIRIES

Direct all warranty and repair requests/inquiries to the OMEGA Customer Service Department. BEFORE RETURNING ANY PRODUCT(S) TO OMEGA, PURCHASER MUST OBTAIN AN AUTHORIZED RETURN (AR) NUMBER FROM OMEGA’S CUSTOMER SERVICE DEPARTMENT (IN ORDER TO AVOID PROCESSING DELAYS). The assigned AR number should then be marked on the outside of the return package and on any correspondence.

The purchaser is responsible for shipping charges, freight, insurance and proper packaging to prevent breakage in transit.

FOR WARRANTY RETURNS, please have the following information available BEFORE contacting OMEGA:
1. Purchase Order number under which the product was PURCHASED,
2. Model and serial number of the product under warranty, and
3. Repair instructions and/or specific problems relative to the product.

FOR NON-WARRANTY REPAIRS, consult OMEGA for current repair charges. Have the following information available BEFORE contacting OMEGA:
1. Purchase Order number to cover the COST of the repair,
2. Model and serial number of the product, and
3. Repair instructions and/or specific problems relative to the product.

OMEGA’s policy is to make running changes, not model changes, whenever an improvement is possible. This affords our customers the latest in technology and engineering.
