GENERAL DESCRIPTION

The CN63500 is a Factory Mutual approved temperature limit alarm, intended to provide an independent shutdown for thermal processes. The CN63500 accepts signals from a variety of temperature sensors (thermocouple or RTD elements), and its comprehensive programming allows it to meet a wide variety of application requirements.

Dual 4-digit displays allow viewing of the process temperature and limit setpoint simultaneously. Front panel indicators inform the operator of the process and output status. The main limit output and alarm outputs are field replaceable.

The limit output is selectable for high or low trip activation. If the process temperature goes above the limit setpoint for a high trip, or below the limit setpoint for a low trip, the limit relay will de-energize to initiate a process shutdown. The limit output cannot be reset until the process temperature returns to the proper operating range; manual reset is required (local or remote). Sensor failure will initiate a process shutdown.

Relay alarm(s) can be configured to activate according to a variety of actions (Absolute HI or LO, Deviation HI or LO, and Band IN or OUT) with adjustable hysteresis. A standby feature suppresses the alarm during power-up until the process stabilizes outside the alarm region.

The unit is constructed of a lightweight, high impact plastic case with a tinted front panel. The front panel meets NEMA 4X/IP65 specifications when properly installed. Multiple units can be stacked horizontally or vertically. Modern surface-mount technology, extensive testing, plus high immunity to noise interference makes the CN63500 extremely reliable in industrial environments.

SAFETY SUMMARY

All safety related regulations, local codes and instructions that appear in the manual or on equipment must be observed to ensure personal safety and to prevent damage to either the instrument or equipment connected to it. If equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

Do not use the CN63500 to directly command motors, valves, or other actuators not equipped with safeguards. To do so can be potentially harmful to persons or equipment in the event of a fault to the unit.

GENERAL SPECIFICATIONS

1. DISPLAY: 2 line by 4-digit LED
   Upper (Main) Display: 0.4" (10.2 mm) high red LED
   Lower (Secondary) Display: 0.3" (7.6 mm) high green LED
Display Messages:
   “OLOL” - Appears when measurement exceeds + sensor range.
   “ULUL” - Appears when measurement exceeds - sensor range.
   “OPEN” - Appears when open sensor is detected.
   “SHrt” - Appears when shorted sensor is detected (RTD only)
   “-...” - Appears when displayed values exceed + display range.
   “...” - Appears when displayed values exceed - display range.

LED Status Annunciators:
   EX - Temperature exceeds limit setpoint
   OUT - Limit output is de-energized
   A1 - Alarm #1 is active
   A2 - Alarm #2 is active

2. POWER:
   Line Voltage Models: 85 to 250 VAC, 50/60 Hz, 8 VA.
   Low Voltage Models:
     DC Power: 18 to 36 VDC, 7 W.
     AC Power: 24 VAC +/-10%, 50/60 Hz, 9 VA
3. CONTROLS: Four rubber push buttons: R, P, Up, Down
4. MEMORY: Nonvolatile EPROM retains all programmable parameters and values.
5. ENVIRONMENTAL CONDITIONS:
   Operating Range: FM rated @ 0 to 65°C, UL rated @ 0 to 55°C
   Storage Range: -40 to 80°C
   Operating and Storage Humidity: 85% max. relative humidity (non-condensing) from 0°C to 65°C.
   Vibration to IEC 68-2-6: Operational 5 to 150 Hz, 2g.
   Shock to IEC 68-2-27: Operational 20 g (10g relay)
   Altitude: Up to 2000 meters
6. ISOLATION BREAKDOWN RATINGS:
   AC line with respect to all inputs and outputs: 2300 V for 1 minute (250 V working)
   Relay contacts to all other inputs and outputs: 2300 VAC
   DC Power with respect to sensor input: 50 V working (500 V for 1 minute)

INPUT SPECIFICATIONS

1. SENSOR INPUT:
   Sample Period: 100 msec
   Step Response Time: Less than 300 msec typ., 400 msec max. (to within 99% of final value)
   Normal Mode Rejection: Greater than 40 dB @ 50/60 Hz
   Common Mode Rejection: Greater than 120 dB, DC to 60 Hz
   Overvoltage Protection: Input overload 120 VAC for 15 seconds max.
2. Failed Sensor Response:
   Main Output: Sensor failure will initiate a process shutdown
   Display: “OPEN”
   Alarms: Upscale
3. INDICATION ACCURACY: ±(0.3% of Span +1°C) at 23°C ambient after 20 minute warm-up. (Includes NIST conformity, cold junction effect, A/D conversion errors and linearity conformity.
   Span Drift (maximum): 130 PPM/°C
4. RTD INPUT: 2 or 3 wire, 100 Ω platinum, alpha = 0.00385 (DIN 43760), alpha = 0.0039162
   Excitation: 150 µA typical
   Resolution: 1 or 0.1 degree
   Lead Resistance: 15 Ω max. per input lead

5. THERMOCOUPLE INPUT:
   Types: T, E, J, K, R, S, B, N, Linear mV, software selectable
   Input Impedance: 20 MΩ all types
   Lead resistance effect: 0.25 µV/Ω
   Cold junction compensation: Less than ±1°C typ., ±1.5°C max, error over 0 to 65°C max. ambient temperature range. Defeated for Linear mV indication mode.
   Resolution: 1° for all types, or 0.1° for T, E, J, K, and N only.

6. REMOTE RESET INPUT: Internally pulled up to +5 VDC (1MΩ).
   VIL: 0.85 V max., VIH: 3.65 V min., VIN MAX: 5.25 VDC, Ioff: 1µA max.
OUTPUT SPECIFICATIONS

1. LIMIT AND ALARM OUTPUT RELAYS:
   Contact Rating: 5 A @ 250 VAC or 30 VDC (resistive load).
   Life Expectancy: 100,000 cycles at max. load rating. (Decreasing load increases life expectancy.)

2. LIMIT OUTPUT: CN63500-R1-AL1: Form-C relay; CN63500R1-AL2: Form-A relay. Selectable for high or low trip activation. If the process temperature goes above the limit setpoint for a high trip, or below the limit setpoint for a low trip, the limit relay will de-energize to initiate a process shutdown. The limit output cannot be reset until the process temperature returns to the proper operating range; manual reset is required (local or remote).

   Annunciators:
   “EX” - Lit when the process temperature exceeds the limit setpoint.
   “OUT” - Lit when the limit output is de-energized.

3. ALARM OUTPUTS (Optional): One or two Form-A relays.
   Modes:
   Absolute High Acting   Absolute Low Acting
   Deviation High Acting   Deviation Low Acting
   Inside Band Acting     Outside Band Acting
   Reset Action: Programmable; automatic or latched. Latched alarms can be reset regardless of limit exceed condition.
   Standby Mode: Programmable; enable or disable.
   Hysteresis: Programmable.
   Annunciator: “A1” and “A2” programmable for normal or reverse acting.

EMC INSTALLATION GUIDELINES

Although this unit is designed with a high degree of immunity to Electromagnetic Interference (EMI), proper installation and wiring methods must be followed to ensure compatibility in each application. The type of the electrical noise, source or coupling method into a unit may be different for various installations. Cable length, routing, and shield termination are very important and can mean the difference between a successful or troublesome installation. Listed are some EMI guidelines for a successful installation in an industrial environment.

1. A unit should be mounted in a metal enclosure, which is properly connected to protective earth.
2. Use shielded cables for all Signal and Control inputs. The shield connection should be made as short as possible. The connection point for the shield depends somewhat upon the application. Listed below are the recommended methods of connecting the shield, in order of their effectiveness.
   a. Connect the shield to earth ground (protective earth) at one end where the unit is mounted.
   b. Connect the shield to earth ground at both ends of the cable, usually when the noise source frequency is over 1 MHz.
3. Never run Signal or Control cables in the same conduit or raceway with AC power lines, conductors, feeding motors, solenoids, SCR controls, and heaters, etc. The cables should be run through metal conduit that is properly grounded. This is especially useful in applications where cable runs are long and portable two-way radios are used in close proximity or if the installation is near a commercial radio transmitter. Also, Signal or Control cables within an enclosure should be routed as far away as possible from contactors, control relays, transformers, and other noisy components.
4. Long cable runs are more susceptible to EMI pickup than short cable runs.
5. In extremely high EMI environments, the use of external EMI suppression devices such as Ferrite Suppression Cores for signal and control cables is effective.
6. To protect relay contacts that control inductive loads and to minimize radiated and conducted noise (EMI), some type of contact protection network is normally installed across the load, the contacts or both. The most effective location is across the load.
   a. Using a snubber, which is a resistor-capacitor (RC) network or metal oxide varistor (MOV) across an AC inductive load is very effective at reducing EMI and increasing relay contact life.
   b. If a DC inductive load (such as a DC relay coil) is controlled by a transistor switch, care must be taken not to exceed the breakdown voltage of the transistor when the load is switched. One of the most effective ways is to place a diode across the inductive load. External diode protection at the load is always a good design practice to limit EMI. Although the use of a snubber or varistor could be used.
7. Care should be taken when connecting input and output devices to the instrument. When a separate input and output common is provided, they should not be mixed. Therefore a sensor common should NOT be connected to an output common. This would cause EMI on the sensitive input common, which could affect the instrument’s operation.
1.0 INSTALLING THE CN63500

The CN63500 meets NEMA 4X/IP65 requirements for indoor use to provide a watertight seal in steel panels with a minimum thickness of 0.09 inch, or aluminum panels with a minimum thickness of 0.12 inch. The units are intended to be mounted into an enclosed panel. It is designed so that the units can be stacked horizontally or vertically. The bezel assembly MUST be in place during installation of the unit.

Instructions:
1. Prepare the panel cutout to the dimensions.
2. Remove the panel latch from the unit. Discard the cardboard sleeve.
3. Carefully remove the center section of the panel gasket and discard. Slide the panel gasket over the unit from the rear, seating it against the lip at the front of the case.
4. Insert the unit into the panel cutout. While holding the unit in place, push the panel latch over the rear of the unit, engaging the tabs of the panel latch in the farthest forward slot possible.
5. To achieve a proper seal, tighten the panel latch screws evenly until the unit is snug in the panel, torquing the screws to approximately 7 in-lbs (79 N-cm). Over tightening can result in distortion of the panel, and reduce the effectiveness of the seal.

Note: The installation location of the CN63500 is important. Be sure to keep it away from heat sources (ovens, furnaces, etc.), and away from direct contact with caustic vapors, oils, steam, or any other process byproducts in which exposure may affect proper operation.

Multiple Unit Stacking
The CN63500 is designed for close spacing of multiple units. Units can be stacked either horizontally or vertically. For vertical stacking, install the panel latch with the screws to the sides of the unit. For horizontal stacking, the panel latch screws should be at the top and bottom of the unit. The minimum spacing from center line to center line of units is 1.96" (49.8 mm). This spacing is the same for vertical or horizontal stacking.

Caution: The bezel assembly contains electronic circuits that can be damaged by static electricity. Before removing the assembly, discharge static charge on your body by touching an earth ground point. It is also important that the bezel assembly be handled only by the bezel itself. Additionally, if it is necessary to handle a circuit board, be certain that hands are free from dirt, oil, etc., to avoid circuit contamination that may lead to malfunction. If it becomes necessary to ship the unit for repairs, place the unit in its case before shipping.

Unit Removal Procedure
To remove a unit from the panel, first loosen the panel latch screws. Insert flat blade screwdrivers between the latch and the case on either side of the unit, so that the latches disengage from the grooves in the case. Push the unit through the panel from the rear.

Removing Bezel Assembly
The bezel assembly must be removed from the case to replace the output board. To remove the bezel assembly, insert a flat blade screwdriver into the pry slot on either side of the unit. Twist the screwdriver handle until the unit is ejected enough to allow removal.
After the unit has been mechanically mounted, it is ready to be wired. All wiring connections are made to the rear screw terminals. When wiring the unit, use the numbers on the label and those embossed on the back of the case, to identify the position number with the proper function. All conductors should meet voltage and current ratings for each terminal. Also cabling should conform to appropriate standards of good installation, local codes and regulations. It is recommended that power supplied to the unit (AC or DC) be protected by a fuse or circuit breaker. Strip the wire, leaving approximately 1/4” (6 mm) bare wire exposed (stranded wires should be tinned with solder). Insert the wire under the clamping washer and tighten the screw until the wire is clamped tightly.

Caution: Unused terminals are NOT to be used as tie points. Damage to the CN63500 may result if these terminals are used.

**POWER WIRING**

**AC Power**

Primary AC power is connected to terminals #11 and #12, labeled AC. To reduce the chance of noise spikes entering the AC line and affecting the CN63500, an AC feed separate from that of the load should be used to power the CN63500. Be certain that the AC power to the CN63500 is relatively “clean” and within the variation limit. Connecting power from heavily loaded circuits or circuits that also power loads that cycle on and off (contacts, relays, motors, etc.), should be avoided.

**DC Power**

DC Power (18 to 36 VDC) is connected to terminals #11 and #12 labeled DC+ and DC- respectively.

⚠️ **CAUTION:** Observe proper polarity when connecting DC voltages. Damage to the unit may occur if polarity is reversed.

**SIGNAL WIRING**

**Thermocouple**

When connecting the thermocouple, be certain that the connections are clean and tight. If the thermocouple probe cannot be connected directly to the CN63500, thermocouple wire or thermocouple extension-grade wire must be used to extend the connection points (copper wire does not work). Always refer to the thermocouple manufacturer’s recommendations for mounting, temperature range, shielding, etc. For multi-probe temperature averaging applications, two or more thermocouple probes may be connected to the CN63500 (always use the same type). Paralleling a single thermocouple to more than one CN63500 is not recommended. Generally, the red wire from the thermocouple is negative and connected to the CN63500’s common.

**RTD**

When connecting the RTD, be certain that the connections are clean and tight. RTD sensors have a higher degree of accuracy and stability than thermocouple sensors. Most RTD sensors available are the three wire type. The third wire is a sense lead for canceling the effects of lead resistance of the probe. Four wire RTD elements may be used by leaving one of the sense leads disconnected. Two wire RTD sensors may be used in either of two ways:

A) Attach the RTD to terminals #8 and #10. Install a copper sense wire of the same wire gauge as the RTD leads. Attach one end of the wire at the probe and the other end to terminal #9. Complete lead wire compensation is obtained. This is the preferred method.

B) Attach the RTD to terminals #8 and #10. Install a shorting wire between terminals #9 and #10. A temperature offset error of 2.5°C/ohm of lead resistance exists. The error may be compensated by programming a temperature offset.

Note: With extended cable runs, be sure the lead resistance is less than 15 ohms/lead.

**RELAY CONNECTIONS**

To prolong contact life and suppress electrical noise interference due to the switching of inductive loads, it is good installation practice to install a snubber across the contactor. Follow the manufacturer’s instructions for installation.

**REMOTE RESET WIRING**

The use of shielded cable is recommended. Follow the EMC installation guidelines for shield connection.

Terminal #6 is the Remote Reset. Any form of mechanical switch may be connected to terminal #6 (REMOTE RESET) and terminal #8 (COMM.). Sinking open collector logic with less than 0.7 V saturation and off-state leakage current of less than 1 µA may also be used.
3.0 FRONT PANEL DESCRIPTION

The front panel bezel material is flame and scratch resistant, tinted plastic that meets NEMA 4X/IP65 requirements, when properly installed. Continuous exposure to direct sunlight may accelerate the aging process of the bezel. The bezel should be cleaned only with a soft cloth and neutral soap product. Do NOT use solvents. There are two 4-digit LED displays, a red upper Main Display and a lower green Secondary Display.

There are up to four panel annunciators, with red backlighting, that illuminate to inform the operator of the CN63500 and output status. See the front panel diagram for a description of the annunciators. Four front panel buttons are used to access different modes and parameters. The following is a description of each button:

- DO NOT use tools of any kind (screwdrivers, pens, pencils, etc) to operate the keypad of this unit.

Button Functions

R - The Reset (R) button is used to reset the limit and alarm relays. The limit output cannot be reset until the process temperature returns to the proper operating range. Latched alarms can be reset regardless of limit exceed condition.

P - The Parameter (P) button is used to access programming, enter the change, and scroll through the available parameters in any mode.

UP, DN - The Up/Down buttons are used to modify parameters.

PARAMETER CONFIGURATION BASIC STARTUP

For basic start-up, it is important to verify or change Input Parameter Module (1-IN) parameters TYPE and SCAL, and Output Parameter Module (2-OP) parameter LIAC (Limit Trip Action). For alarm set-up, it is important to verify or change Alarms Parameter Module (4-AL) parameters AC1, AL-1, AC2, and AL-2.

If the above Input parameters or the input wiring connections are not correct, then the main (top) display may display an error message or incorrect value. Verify the input programming and wiring. (If incorrect display continues, refer to the Troubleshooting section.) All other parameter configurations are important but will not prevent the CN63500 from showing a correct display.

4.0 PARAMETER MODE

The Parameter Mode is accessed by pressing the P Button from the Normal Display Mode. While in the Parameter Mode, the temperature is displayed in the main (top) display, and the limit setpoint is displayed in the secondary (bottom) display. The correct password must be entered before any parameters can be accessed. To modify values, use the UP or DOWN button while the parameter is displayed. Use the P button to accept the new value, and to scroll through the parameters. The CN63500 will automatically return to the normal display mode if no action is taken. The CN63500 responds to the new display and the revision number of the CN63500's operating system in the secondary (bottom) display.

The CN63500 checks for correct internal operation and displays an error message (E-xx) if an internal fault is detected. (See the Troubleshooting section for further information.) Upon completion of this sequence, the CN63500 begins displaying the input value and setpoint, and updates the outputs based upon this condition.

C63500 CONFIGURATION OVERVIEW

The CN63500 is programmed with certain parameter settings from the factory. Factory settings are listed in parentheses in the various Configuration of Parameters tables. In many cases, these settings must be changed to the particulars of the application before proper operation can be started.

The CN63500 is typically in the Normal Display Mode. In this mode, the process temperature is displayed in the main (top) display, and the limit setpoint is displayed in the secondary (bottom) display. When changes to the parameter configurations are needed, the P button is pressed, and the CN63500 will enter into the Parameter Mode.

</tr>
<tr>
<td>End</td>
<td>End of Parameter Mode</td>
<td></td>
<td>When the parameter list has been scrolled through, the CN63500 will display “End” momentarily, and then return to the normal display mode.</td>
</tr>
</tbody>
</table>

* Model Number Dependent.
CONFIGURATION PARAMETER MODULES

The Configuration Parameter modules are accessed by pressing the UP button from CNFP in the Parameter Mode. The UP or DOWN buttons can be pressed to move to the desired Parameter Module. The P button is then pressed to enter into that module. The main (top) display will be the parameter, and the secondary (bottom) display will be the parameter value. The UP or DOWN buttons are used to modify the desired parameter value, and the P button enters the new value, and moves to the next parameter. The CN63500 responds to the new values after the P button is pressed, however, the change is not committed to permanent memory until the CN63500 is returned to the Normal Display Mode. If power loss occurs before returning to the Normal Display Mode, the new values must be entered again. At the end of each module, the CN63500 will go back to CNFP. Other Parameter Modules can be accessed by pressing the UP or DOWN buttons, or pressing P will return to the Normal Display Mode.

Parameters that are model number, or program dependent will only be displayed when the appropriate options are installed or programmed.

</tr>
</thead>
<tbody>
<tr>
<td>PASS</td>
<td>Password</td>
<td>0 to 250 (10)</td>
<td>The password is required to access all parameters. The password can be set to any value between 0 and 250. A wildcard password, 222, can be used as an alternative to the programmed password.</td>
</tr>
</tbody>
</table>
| AL *    | Alarms #1 and #2 access level | LOC - lockout, prevents the alarms from appearing
rEd - read only, alarms appear, but cannot be modified
Ent - enter, alarms appear, and can be modified (Ent) | The alarm(s) parameter in the Parameter Mode can be configured to be completely locked out, read only, or fully accessible. |
| FPtS    | Front panel reset        | NO - disabled
YES - active (YES) | The front panel R button can be enabled or disabled. The Remote Reset input is not affected by this setting. |

* Model Number Dependent.

### Configure Module 4 - Alarms Parameters (4-AL)

<table>
<thead>
<tr>
<th>DISPLAY</th>
<th>PARAMETER</th>
<th>RANGE (FACTORY SETTING)</th>
<th>DESCRIPTION/ COMMENTS</th>
</tr>
</thead>
</table>
| Act1    | Alarm 1 action mode      | A-HI - absolute high
A-LO - absolute low
d-HI - deviation high
d-LO - deviation low
b-IN - band inside
b-Ot - band outside (A-HI) | When deviation low-acting with positive alarm value (d-LO), deviation high-acting with negative value (d-HI), or band inside-acting (b-IN) is selected for the alarm action, the indicator is OFF when the alarm output is OFF. See the Alarms section for complete details of each action. **If changed, check alarm values.** |
| rSt1    | Alarm 1 reset mode       | Auto - automatic
LATC - manual reset (Auto) | Automatic reset alarms are reset by the CN63500 when the alarm condition clears. Latched alarms require operator action to reset the alarm condition. The front panel R button, if enabled, can be used to reset a latched alarm (see FPtS in Configure Module 3). A latched alarm condition may also be reset via the Remote Reset input. See the Reset Action diagram in the Alarms section. |
| Stb1    | Alarm 1 standby function (delay) | NO or YES (NO) | The alarm(s) may be independently configured to exhibit a power-on, standby delay which suppresses the alarm output from turning ON until the temperature first stabilizes outside the alarm region. After this condition is satisfied, the alarm standby delay is canceled and the alarm triggers normally, until the next CN63500 power-on. This feature also works for deviation and band alarms when the setpoint is changed via keypad. This action suppresses “nuisance” alarms. See the Alarm Standby diagram in the Alarms section. |
| AL-1    | Alarm 1 value            | -999 to 9999 (0)        | The alarm values are either absolute values, or relative to the limit setpoint value (deviation and band alarms). An absolute alarm value is the value that is entered for the alarm. A relative alarm value is the mathematical sum of the temperature limit setpoint value and the alarm value (positive or negative), thus a relative alarm tracks the limit setpoint value as it is changed. If the alarm action is set as a Band Alarm, then only a positive alarm value can be entered. |
| Act2 *  | Alarm 2 action mode      | A-HI - absolute high
A-LO - absolute low
d-HI - deviation high
d-LO - deviation low
b-IN - band inside
b-Ot - band outside (A-HI) | The Alarm 2 parameters are programmed independently of alarm 1. See the corresponding Alarm 1 parameter for description. |
| rSt2 *  | Alarm 2 reset mode       | Auto - automatic
LATC - manual reset (Auto) | |
| Stb2 *  | Alarm 2 standby function (delay) | NO or YES (NO) | |
| AL-2 *  | Alarm 2 value            | -999 to 9999 (0)        | |
| AHYS    | Alarm hysteresis value   | 1 to 250 (1)            | The alarm value(s) have a programmable hysteresis band to prevent alarm output chatter near the alarm trigger point. The hysteresis value should be set to eliminate this effect. A value of 2 to 5 is usually sufficient for most applications. A single alarm hysteresis value applies to both alarms. See the Alarm Action Figures, in the Alarms section, for the effect of hysteresis on the various alarm types. |

* Model Number Dependent.

9
LIMIT OUTPUT ACTION

The limit output is selectable for high or low trip activation. If the process temperature goes above the limit setpoint for a high trip, or below the limit setpoint for a low trip, the limit relay will de-energize to initiate a process shutdown. The limit output cannot be reset until the process temperature returns to the proper operating range; manual reset is required. The following action figures describe the status of the limit output and the front panel indicators for various over/under setpoint, and reset conditions. Reset is either by the front panel R button, if enabled, or by the Remote Reset input, terminal #6. Refer to Configure Module 2 - Output Parameters for details of configuring the limit output. Refer to Configure Module 3 - Lockout Parameters for details of configuring the front panel Reset button.

5.0 ALARMS (OPTIONAL)

The alarm action figures describe the status of the alarm output and the front panel indicator for various over/under temperature conditions. The alarm output wave form is shown with the output in the automatic reset mode. Select the alarm action with care — in some configurations, the front panel indicator (LED) might be OFF while the output is ON. Refer to Configure Module 4 - Alarm Parameters for details of configuring the alarms.

**Alarm Reset Sequence**

**Alarm Standby Delay Sequence**

---

**Calibration Checks**

The instrument has been fully calibrated at the factory for all input types. If the unit appears to be indicating or controlling incorrectly, see the Troubleshooting section before attempting this procedure.

If the CN63500 is suspected of reading incorrectly, the instrument may be checked for indication accuracy without disturbing the factory calibration. The following procedures may be used for this purpose.

*Note: Allow ½ hour warm-up before checking these parameters.*

**mV Reading Check**

1. Connect a DC mV source with an accuracy of 0.03% or better to terminal #8 (-) & #9 (+).
2. Configure Input Parameters Module 1 for linear mV (Lin) input, under Type.
3. Compare the CN63500 read-out to the standard at various points over the range (-5.00 mV to 56.00 mV). The tolerance is ±(0.15% of reading + 1 LSD).
4. Calibrate the CN63500 if the readings are out of tolerance.

**Thermocouple Cold Junction Temperature Check**

1. Connect a thermocouple probe of known accuracy (Types T, E, J, K, N only) to CN63500. Select the probe used in Configure Module 1.
2. Connect a reference temperature probe to measuring end of thermocouple to monitor temperature. Allow sufficient time for temperatures to equalize.
3. Compare CN63500 display with reference temperature probe. The CN63500 display should equal the calibrated probe temperature. (Tolerance is ±1°C.)
4. Calibrate the cold junction temperature if out of tolerance.

**RTD Ohms Reading Check**

1. Connect RTD simulator (with an accuracy of 0.1 ohm or better) capable of operating with less than 150 µA to terminals #8, #9, & #10.
2. Configure Input Parameters Module 1 for linear ohms (rLin) input, under Type.
3. Compare the CN63500 read-out with the RTD simulator at various points over the range 2.0 to 300.0 ohms. The tolerance is ±(0.3% of span + 1 LSD).
4. Calibrate the CN63500 RTD ohms if out of tolerance.

**Error Flag E-CL**

If error flag “E-CL” appears at power-up, a loss of calibration parameters due to noise spikes has occurred. Entering code 77 twice in Factory Service Operations Module (9-FS) erases the CN63500 calibration values and defaults the values to nominal settings. Reading errors of ±10% may result. It is recommended that the CN63500 be fully recalibrated. If using thermocouple only, the RTD calibration need not be performed.

*Note: the “E-CL” flag may be cleared by “stepping” through cold junction calibration procedure without the need to change any calibration values. A ±10% reading error will still exist.*

---

**DEVIATION LOW-ACTING WITH POSITIVE ALARM VALUE (d-LO)**

**DEVIATION LOW-ACTING WITH NEGATIVE ALARM VALUE (d-LO)**

**BAND INSIDE ACTING (b-IN)**

**BAND OUTSIDE ACTING (b-Ot)**

---

---
# 6.0 Calibration

When re-calibration is required (generally every two years), this procedure should be performed by qualified technicians using appropriate equipment. Equipment source accuracy of 0.03% or better is required.

The procedure consists of: applying accurate mV signals, setting the thermocouple cold junction temperature, and applying precision resistance, among others. Allow a 30 minute warm-up period before starting this procedure. Do not use thermocouple wire for the millivolt or RTD ohms calibration.

## Millivolt Calibration (CAL)
Connect precision millivolt source with an accuracy of 0.03% to terminals #8 (-) & #9 (+). Cold Junction or RTD ohms calibration MUST be performed after millivolt calibration.

### Millivolt Calibration (CAL)

Connect precision millivolt source with an accuracy of 0.03% to terminals #8 (-) & #9 (+). Cold Junction or RTD ohms calibration MUST be performed after millivolt calibration.

### Cold Junction Temperature Calibration (CJC)
Note: If the initial value for CJC is not within the range of 15°C to 40°C, enter 25.0°C and repeat the Cold Junction Calibration procedure.

### Millivolt Calibration (CAL)

This procedure may be aborted by disconnecting power to the CN63500 before exiting the configuration mode. The existing calibration settings remain in effect.

Note: After completing any of the calibration sequences, the CN63500 defaults the input sensor type to thermocouple type “J” (tc-J). Be sure to set input sensor for proper type.

Note: The CN63500 must be restored to normal display mode before any data is stored.

### Factory Service Operations - Calibration (9-FS)

### Thermocouple Cold Junction Calibration (CJC)

This procedure must be performed AFTER an accurate mV calibration.

2. Connect a thermocouple probe of known accuracy to the CN63500 (Types T, E, J, K, and N only). Select the probe type used in Configure Module 1.
3. Connect a reference temperature probe to the measuring end of the CN63500 thermocouple probe. The two probes should be shielded from air movement and allowed sufficient time to equalize in temperature. (As an alternative, the CN63500 thermocouple probe may be placed in a calibration bath of known temperature.)
4. Compare CN63500 display with reference temperature probe (or calibration bath). If the displayed CN63500 temperature does not equal the reference probe temperature, calculate the CJ error as follows:

\[
CJ\text{ Error} = \text{reference probe temperature} - \text{displayed CN63500 temperature}
\]
5. Enter Factory Service Operations Module (9-FS).

### Thermocouple Cold Junction Calibration (CJC)

<table>

</tr>
</tbody>
</table>

Note: If the initial value for CJC is not within the range of 15°C to 40°C, enter 25.0°C for CJC and repeat the Cold Junction Calibration procedure.
# 7.0 TROUBLESHOOTING

The majority of problems can be traced to improper connections or incorrect set-up parameters. Be sure all connections are clean and tight, that the correct output board is fitted, and that the set-up parameters are correct. For further technical assistance, contact technical support at the appropriate company numbers listed.

8.0 Installing an Output Board

The CN63500 is supplied with an output board installed.

Replacing Output Board
1. Remove the bezel assembly.
2. Lift up on the top bezel board latch while gently pulling out on the bezel/display board assembly. Do NOT remove the display board from the bezel.
3. Remove the output board by pulling it away from the other boards. Replace the output board by aligning the board to board connector. Be certain the connector is fully mated.
4. Connect the bezel/display board assembly by guiding the board ends into the bezel latches. Slide the assembly on evenly until the display board connector is completely engaged and bezel latches are fully seated onto the boards.

**WARRANTY/DISCLAIMER**

OMEGA ENGINEERING, INC. warrants this unit to be free of defects in materials and workmanship for a period of 25 months from date of purchase. OMEGA's WARRANTY adds an additional one (1) month grace period to the normal two (2) year product warranty to cover handling and shipping time. This ensures that OMEGA's customers receive maximum coverage on each product.

If the unit malfunctions, it must be returned to the factory for evaluation. OMEGA's Customer Service Department will issue an Authorized Return (AR) number immediately upon phone or written request. Upon examination by OMEGA, if the unit is found to be defective, it will be repaired or replaced at no charge. OMEGA's WARRANTY does not apply to defects resulting from any action of the purchaser, including but not limited to mishandling, improper interfacing, operation outside of design limits, improper repair, or unauthorized modification. This WARRANTY is VOID if the unit shows evidence of having been tampered with or shows evidence of having been damaged as a result of excessive corrosion; or current, heat, moisture or vibration; improper specification; misapplication; misuse or other operating conditions outside of OMEGA's control. Components in wear which is not warranted, include but are not limited to contact points, fuses, and triacs.

OMEGA is pleased to offer suggestions on the use of its various products. However, OMEGA neither assumes responsibility for any omissions or errors nor assumes liability for any damages that result from the use of its products in accordance with information provided by OMEGA, either verbal or written. OMEGA warrants only that the parts manufactured by the company will be as specified and free of defects. OMEGA MAKES NO OTHER WARRANTIES OR REPRESENTATIONS OF ANY KIND WHATSOEVER, EXPRESSED OR IMPLIED, EXCEPT THAT OF TITLE, AND ALL IMPLIED WARRANTIES INCLUDING ANY WARRANTY OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE HEREBY DISCLAIMED. LIMITATION OF LIABILITY: The remedies of purchaser set forth herein are exclusive, and the total liability of OMEGA with respect to any order, whether based on contract, warranty, negligence, indemnification, strict liability or otherwise, shall not exceed the purchase price of the component upon which liability is based. In no event shall OMEGA be liable for consequential, incidental or special damages.

CONDITIONS: Equipment sold by OMEGA is not intended to be used, nor shall it be used: (1) as a "Basic Component" under 10 CFR 21 (NRC), used in or with any nuclear installation or activity, medical application, used on humans, or misused in any way, OMEGA assumes no responsibility as set forth in our basic WARRANTY/DISCLAIMER language, and, additionally, purchaser will indemnify OMEGA and hold OMEGA harmless from any liability or damage whatsoever arising out of the use of the Product(s) in such a manner.

**RETURN REQUESTS/INQUIRIES**

Direct all warranty and repair requests/inquiries to the OMEGA Customer Service Department. BEFORE RETURNING ANY PRODUCT(S) TO OMEGA, PURCHASER MUST OBTAIN AN AUTHORIZED RETURN (AR) NUMBER FROM OMEGA'S CUSTOMER SERVICE DEPARTMENT (IN ORDER TO AVOID PROCESSING DELAYS). The assigned AR number should then be marked on the outside of the return package and on any correspondence. The purchaser is responsible for shipping charges, freight, insurance and proper packaging to prevent breakage in transit.

**FOR WARRANTY RETURNS**, please have the following information available BEFORE contacting OMEGA:

1. Purchase Order number under which the product was PURCHASED,
2. Model and serial number of the product under warranty, and
3. Repair instructions and/or specific problems relative to the product.

**FOR NON-WARRANTY REPAIRS**, consult OMEGA for current repair charges. Have the following information available BEFORE contacting OMEGA:

1. Purchase Order number to cover the COST of the repair,
2. Model and serial number of the product, and
3. Repair instructions and/or specific problems relative to the product.

OMEGA’s policy is to make running changes, not model changes, whenever an improvement is possible. This affords our customers the latest in technology and engineering. OMEGA is a registered trademark of OMEGA ENGINEERING, INC.
