INTRODUCTION

The Omega FTB-14XX-AMP Magnetic Pick-up with Preamplifier was designed to directly replace a standard pick-up within a turbine flow meter when signal amplification is required. The pick-up is a combination of a standard Omega magnetic pick-up and a solid state electronic preamplifier in a single stainless steel housing.

OPERATING PRINCIPLE

As fluid flows through the meter the turbine rotates at a speed proportional to the fluid velocity. As each turbine blade passes through the magnetic field at the base of the pickup, an AC voltage pulse is generated in the pick-up coil. The voltage signal generated by these pulses becomes amplified within the pick-up. The output signal generated from the pick-up is now in the form of a square wave. The frequency of this amplified signal is used to represent the flow rate of fluid passing through the turbine flow meter.
