GETTING STARTED

1. Install the control as described on page 3.

2. Wire your control following the instructions on page 5. If you are using a two-wire transmitter as an input, see the drawing and instructions on page 6. Option wiring instructions are on page 7. Option descriptions and specific instructions start on page 16.

3. Most controls do not need many (if any) program changes to work on your process. For best results when programming changes are necessary, make all the necessary changes in the Secure Menu (page 26) before making changes to the Secondary Menu (page 19). If error messages occur, check the Diagnostic Error Messages on page 35 for help.

Take the example of a CN72011 that comes from the factory programmed for type J thermocouples. Suppose for this example you wish to change the input to type K and limit the set point range between 0° and 1000° C.

First, enter the Secure menu as instructed on page 5. Press the INDEX key until the display shows **Inp** and press the DOWN ARROW until the display shows **CA**. Don't forget to press the ENTER key to retain your setting.

Next, press the INDEX key to display **Unit**. Press the DOWN ARROW until the display shows **C**. Press ENTER.

Next, press the INDEX key until **SPL** is displayed (pass the **dPt** and **InPt** selections). Press the UP ARROW until the display shows **0**. Press ENTER.

Finally, press INDEX key to display **SPH**. Press the DOWN ARROW until the display shows **1000**. Press ENTER.

The necessary program changes are now complete. After 30 seconds the display will switch back to the temperature reading. If you want to return faster, press the UP ARROW and ENTER keys (at the same time) and then press the DOWN ARROW and INDEX keys (again at the same time). This will 'back out' of the menu and immediately display the temperature reading.

If you want to use Self Tune, Auto/Manual, or the Ramp/Soak Programmer features, see the special sections on these items. Page numbers for these are in the Contents section on the previous page.

* 15VDC output is always available on output types 1 and 3.

INSTALLATION

Mount the instrument in a location that will not be subject to excessive temperature, shock, or vibration (see Specifications for specific tolerances). All models are designed for mounting in an enclosed panel.

Select the position desired for the instrument on the panel. Prepare the panel by cutting and deburring the required opening.

From the front of the panel, slide the housing through the cut out. The housing gasket should be against the housing flange before installing.

From the rear of the panel slide the mounting collar over the housing. Hold the housing with one hand and using the other hand, push the collar evenly against the panel until the springs are compressed. The ratchets will hold the mounting collar and housing in place.

![Panel Cutout Diagram]

Page 4
**WIRING**

Do not run thermocouple or other class 2 wiring in the same conduit as power leads. Use only the type of thermocouple or RTD probe for which the control has been programmed. Maintain separation between wiring of sensor, auxiliary in or out, and other wiring. See the "Secure Menu" for input selection.

For thermocouple input always use extension leads of the same type designated for your thermocouple.

Supply connections should be made in accordance with the National Electrical Code per Article 300, and local regulations. All line voltage output circuits must have a common disconnect and be connected to the same pole of the disconnect.

Input wiring for thermocouple, current, and RTD; and output wiring for 15 VDC is rated CLASS 2.

Control wiring is as shown.
Wiring for Transmitter inputs

Wire power and outputs as shown on previous page. Two-wire transmitters wire as shown below. All wiring shown below is Class 2.

For three or four wire transmitters follow the wiring instructions provided with your transmitter.

DO NOT WIRE THE 24 VOLT POWER SUPPLY ACROSS THE INPUT OF THE CONTROL. DAMAGE TO THE CONTROL INPUT CIRCUITRY WILL RESULT.

Wiring for 15 VDC Outputs

The 15 VDC output is always available on relay or SSR output controls. If you wish to drive a DC triggered external SSR or other DC triggered device, simply wire the device to the indicated terminals as shown on the previous page.

Program the output with the Out1 and / or Out2 menu items as shown on pages 19 and 20.

When this feature is used on a relay output control, you will still hear the internal relay switch. This is normal, and does not affect the operation of the control.
Wiring for Optional Inputs and Outputs

Wire power and outputs as shown on page 5. Wiring for options is shown below. All wiring shown below is Class 2. Shielded twisted pair is recommended for Option 992.

</table>

**Warning:** DO NOT RUN SIGNAL WIRING IN THE SAME CONDUIT OR CHASE AS THE POWER WIRING. ERRATIC OPERATION OR DAMAGE TO THE CONTROL CIRCUITRY WILL RESULT.

**Switch Contacts for Option -4SP** MUST BE ISOLATED AND CAN NOT SHARE WIRING WITH OTHER CONTROLS.
FRONT PANEL KEY FUNCTIONS

Heater Break Lamp
Set Point 1 Lamp
Set Point 2 Lamp
Process Display
Set Point Display
Manual Indicator

The decimal point flashes when Self-Tune is operating.

Key functions are as follows:

INDEX: Pressing the INDEX key advances the display to the next menu item. May also be used in conjunction with other keys as noted below.

UP ARROW: Increments a value, changes a menu item, or selects the item to ON. The maximum value obtainable is 9999 regardless of decimal point placement.

DOWN ARROW: Decrements a value, changes a menu item, or selects the item to OFF. The minimum value obtainable is -1999 regardless of decimal point placement.

ENTER: Pressing ENTER stores the value or the item changed. If not pressed, the previously stored value or item will be retained. The display will flash once when ENTER is pressed.

AUTO/MANUAL: This key toggles the control output between Automatic mode and Manual mode. Press and hold key for three seconds to activate. See section on AUTO/MANUAL operation on Page 14.

RUN/HOLD: This key toggles the Ramp/Soak programmer functions between Run mode (program runs as set up), and Hold mode (program functions are suspended). Press and hold key for three seconds to activate. See section on Programmer Functions (Page 10) for further details.
UP ARROW & ENTER: Pressing these keys simultaneously brings up the secondary menu starting at the alarm, tune, or cycle item (depending on programming). Pressing these keys for 5 seconds will bring up the secure menu.

INDEX & DOWN ARROW: Pressing these keys simultaneously will allow backing up one menu item, or if at the first menu item they will cause the display to return to the primary menu. If an alarm condition has occurred, these keys may be used to reset the alarm.

INDEX & ENTER: Pressing these keys simultaneously and holding them for 5 seconds allows recovery from the various error messages. The following menu items will be reset:

- ALIH: Alarm inhibit
- OPEn InP: Input error message
- bAd InP: Input error message
- CHEC CAL: Check calibration error

Correct the problems associated with the above conditions before using these reset keys. More than one error could be present. Caution is advised since several items are reset at one time.

While in the Primary or Secondary Menu, if no key is pressed for a period of 30 seconds, the display will return to the HOME position displaying the temperature value. While in the Secure Menu, if no key is pressed for a period of 60 seconds, the display will return to the HOME position displaying the temperature value. Outputs are disabled (turned off) when the Secure Menu is active.

NOTE: To move to the Primary Menu quickly from any other menu, press the UP ARROW & ENTER keys followed by pressing the INDEX & DOWN ARROW keys.

SECURITY LEVEL SELECTION

Four levels of security are provided. The display shows the current security level. To change security levels change the password value using the UP & DOWN ARROW keys and pressing the ENTER key. Refer to the password table (following) for the correct value to enter for the security level desired. The SECr menu item security level may be viewed or changed at any time regardless of the present security level.

To set the access level to, for example, 2, at the SECr menu item press the UP ARROW key until the upper display show the password, 1101. Press the ENTER key. The display will blink, and return with the level value, 2, in the upper display.
The password values shown in the table cannot be altered, so retain a copy of these pages for future reference. This is the only reference made to password values in this instruction book.

**NOTATION CONVENTIONS FOR THE MENUS**

Because of the number of features available in this control, information is included that may not apply to your specific control. All usable features are included in this book, but may not be used in your process. To increase clarity the following conventions are used:

1. Certain features or functions shown in this book are contextual. This means that Menu Items may or may not appear, depending on other Menu Item selections. Whenever this occurs, a notation is made in the Menu Item that "controls" or "directs" other menu items. If you are looking for a particular menu item and can't find it, check the menu item that is its "control" for proper setting.

2. The "#" symbol is used in two ways. It is used inside a group of characters to indicate which set point function (SP1 or SP2) is being affected. It is also used before a group of characters of a menu item to indicate that there may be more than one selection or value for that menu item. This is used for certain repeated items such as in the Ramp/Soak Program section.
THE HOME DISPLAY

The home display is the normal display while the control is operating. If no errors or functions are active, the HOME display will indicate the Process Variable (the temperature, pressure, flow, RH, etc., that is being measured) on the top display and the Set Variable (Set Point 1) on the bottom.

Items that can change the HOME display are the Auto/Manual function, the Run/Hold function, the Prog function, the PctO function, and any error message. Description of these special displays follow.

If the Auto/Manual key is pressed, the Manual indicator lights, and the home display is changed. The upper display continues to show the Process Variable (PV), but the lower display changes to show the percentage of output in tenths of a percent to 99.9% (0.0 to 99.9), or 100 if 100%. The display digit to the right of the number shows a flashing letter Ω to indicate that the value displayed is no longer the SV, but percent output. The SP2 output is indicated by the use of an overline on the letter ò. Access to the SP2 value is done by the INDEX key. See Auto/Manual Operation on Page 13 for further information.

If Prog is turned On, the HOME display changes the SV display from SP1 to the Present Set Variable as calculated by the Ramp/Soak Programmer function. See Programming and Operation for Ramp/Soak Feature below for more information.

If PctO (Secondary Menu) is turned On, the lower display changes to show the active percentage of output as required to maintain SP1. The display is similar to the Auto/Manual display above, except that the letter indicators do not flash, and the output is displayed in whole percentages of output, not in tenths of a percent. If the control has both SP1 and SP2, the lower display will alternate between the SP1 percent output and the SP2 percent output.

Error messages are listed on Page 35.

PROGRAMMING AND OPERATION FOR RAMP / SOAK FEATURE

The ramp / soak feature offers a great deal of flexibility by allowing changes in the set point to be made over a predetermined period of time. Dwell times can be programmed, and the alarm output relays can be programmed to open or close during any of the segments.

Theory of Operation
The CN72000 Series controls offer a very simple approach to programming a ramp. Rather than requiring the operator to calculate an approach rate (usually in degrees per minute), the CN72000 does the calculation inter-
nally. Thus, the operator only needs to program the target set point and the
time desired to reach that point. When the ramp segment is executed by
the control, it calculates the ramp required to move the process from the
starting value (current PV) to the desired value (programmed SP) in the
time allowed.

Soaks (or dwells) are segments where the target set point is the same as
the beginning process value. This allows for multistage ramps without
wasting intermediate soak steps. Care must be taken, however, that the
process does actually reach the soak value before the soak time starts. If
not, the next segment will calculate a slope from the starting PV to the target
SP. Depending on your process requirements, this difference may be
important. Make sure to test any program for desired results before running
production material.

Do not operate Self Tune while a ramp function is operating. The
ramp function will prevent the Self Tune from operating properly.
Make sure that all tuning is set up before operating Ramp / Soak.

Program Setup

All of the programming for the Ramp / Soak function is done in the
Secondary Menu. You may wish to work out your program on paper before
going into the programmer menu sequence.

In the Secondary Menu INDEX to Prog and make sure that Prog is set to
OFF.

INDEX to PSet and turn On.

Skip the Stat setting (this is discussed later) and press INDEX to 1ti.

The following items repeat in the following order: 1ti, 1SP, 1A1 (if alarm 1
is programmed as an event), 1A2 (if alarm 2 is programmed as an event),
2ti, 2SP, 2A1, 2A2, . . . , 16ti, 16SP, 16A1, 16A2. To avoid repetition each
item will only be described once.

Set 1ti to the amount of time you want for the first ramp. This value is in
time units (determined by the tbAS menu item) from 0 to 9999. Press
INDEX

Set 1SP to the target value desired for the first ramp. This value is in actual
units just like SP1. If the control is programmed for temperature, then the
SP displays are in temperature. If the control is programmed for some other
engineering unit, the SP is set in that unit.

Page 12
Press INDEX to continue. If Alarm 1 is programmed as an event, then 1A1 will appear. If you wish the Alarm 1 contact to function for this segment, set 1A1 for On. If not, set for OFF. Press INDEX. If Alarm 1 is not programmed as an event, then 1A1 will not appear. If 1A1 is set to On, the Alarm 1 function will be active for the entire period as set in 1ti above.

If Alarm 2 is programmed as an event, then 1A2 will appear. If you wish the Alarm 2 contact to function for this segment, set 1A2 for On. If not, set for OFF. Press INDEX. If Alarm 2 is not programmed as an event, then 1A2 will not appear. If 1A2 is set to On, the Alarm 2 function will be active for the entire period as set in 1ti above.

Complete setting the segment times (2ti ... 16ti), segment set points (2SP ... 16SP), and event alarms (2A1 ... 16A1 and / or 2A2 ... 16A2) if they exist.

For Unneeded or unused segments set the segment times (2ti ... 16ti) to 0, and set the segment set points (2SP ... 16SP) to the same value as the last active set point. Event alarms may be set to indicate “end of run” as you feel necessary.

The last menu item for the ramp / soak function is PEnd. PEnd determines what the control does when the program has ended. You may choose to have the program repeat (LooP), Hold the last set point (16SP), revert to the local SP1, or turn the outputs off (OoFF).

It is important to remember that if you want the program to repeat, you must allow the process to return to the same condition that existed when the program first started. Remember that the ramp function calculates the slope by drawing a line from the beginning PV to the ramp target set point. If the PV at the end of the program is different than the PV at the initial start, the ramp will calculate differently.

Ramp / Soak Operation

When you wish to start the program, enter the Secondary Menu and set the Prog menu item to On. Return to the HOME position by waiting for the display to time out or by pressing the UP ARROW / ENTER keys and then the DOWN ARROW / INDEX keys.

The home display will read as it normally does. The HOLD indicator over the RUN / HOLD key will be lit. To start the program press the RUN / HOLD key. The HOLD indicator will go out, and the program will start.
To suspend the program at any time, press the RUN / HOLD key. Press the key again to resume.

Pressing the AUTO / MANUAL key will also suspend the program operation. The difference is that AUTO / MANUAL also puts the control into manual mode. See Auto / Manual Operation on page 13.

The function of the Primary Menu will change depending on the setting of the Stat menu item in the Secondary Menu. If Stat is OFF then the Primary Menu is not changed.

If the Stat menu item is set to On, then the Primary Menu has three additional information items added before SP1 appears. The first INDEX item, ####/ti, displays the time remaining in the current segment. The next INDEX item, #######ti, displays the total time for the active segment (1ti..16ti). The third INDEX item, #######SP, displays the segment set value (1SP..16SP). The next INDEX press resumes the normal Primary Menu.

**AUTO / MANUAL OPERATION**

The AUTO / MANUAL function allows you to manually adjust the output of the control. This is normally used during process setup or start up. It can also be used for troubleshooting. To switch from AUTO to MANUAL press and hold the AUTO / MANUAL key for three seconds. The MANual indicator will light and the lower display will change from normal to showing the actual output in percent. The value will be the actual percentage of output that was active when the key was pressed. This is usually known as "bumpless transfer".

If you wish to change the output while in manual, press the UP ARROW or DOWN ARROW keys to change the value, and press ENTER to retain it. It is important to remember that the value of the display is read as 0 to 100% of the full control output, NOT the range between S1OL and S1OH or S2OL and S2OH. For example, if the set point one output is programmed for 4 to 20 mA (S1OL=20, S1OH=100), a reading of 50% in MANUAL represents 10 mA, not 12mA. This allows the operator to go above and below the output range to allow for improperly function equipment that may be connected to the control output.

To return to AUTOMATIC control, press and hold the AUTO / MANUAL key again for three seconds. The MANual indicator will go out, and the set point will take over. If you want bumpless transfer back to AUTO, slowly change the percentage of output until the process variable matches (or at least is close) to the set point. The further away the PV is from the set point, the greater the "bump" or upset there will be in the output.
OPERATION OF SELF TUNE FUNCTION

Self Tune allows automatic selection of the necessary parameters to achieve best control operation from your CN72000 Series control. If you are using the control output as a simple on-off function (Out1 set for OnOF), none of the following will apply.

Theory of Operation

The Self Tune function calculates the Pb1, rES, and rtE parameters under the PID tunE selection, and the Fbnd and FrtE parameters, as shown in the Secondary Menu. These values are determined by measuring the response of the process connected to the control. When Self Tune is started, the control temporarily acts as an on-off control. While in this mode the control measures the overshoot and undershoot of the process, and the period of the process (the time from peak value to the next peak value). These measurements are collected over a period that lasts three periods of overshoot and undershoot. The data collected over this time is then compared and calculated into final PID and Fuzzy Logic values. The effect of Fuzzy Logic on the process is still controlled by the Fint (fuzzy intensity) setting. If Fint is 0, the Fbnd and FrtE will be calculated, but will have no effect. The calculations for the PID values are the same as used in the standard Ziegler - Nichols equations that have been recognized as standard for decades.

The only modification to the application of the Ziegler - Nichols equations is controlled by the dFAC menu item. This menu item controls the amount of rate (derivative) that is applied. A dFAC setting of 3 (factory default) or less allows for less damping. A dFAC setting of 4 allows for critical damping as set forth in Ziegler - Nichols. A dFAC setting of 5 or more allows over damping of the process.

Program Setup and Operation

In the secondary menu set tunE to SELF. Skip LErn and check to make sure that dFAC is set to the desired value. Back up to LErn and set to YES. The control will begin the Self Tune function. While the Self Tune function is active, the right hand decimal point on the lower display will blink. When Self Tune is complete, the blinking will stop.

After Self Tune is complete, the tunE setting automatically switches to PID. This allows examination and / or modification of the values calculated. We recommend that you do not change the calculated values unless you have a firm understanding of the parameters involved and their function. For more information on PID tuning, please contact your supplier.
OPERATION AND PROGRAMMING OF OPTIONS

Options -RSP2, -RSP1 Analog Remote Set Point
The analog remote set point allows the control set point to be determined by an outside analog signal. The signal may be 0 to 10 VDC (Option -RSP2), or 0 (or 4) to 20 mA (Option -RSP1).

Wire the input as shown on page 7.

To set up the analog remote set point, first determine the scale range that the analog signal will represent. The maximum span is 11,998 degrees or counts. In the Secure Menu set \( rSCL \) for the scale value that will be represented by the low end of the analog signal (0 Volts, 0 mA). Set \( rSCH \) for the scale value that will be represented by the high end of the analog signal (10 Volts, 20 mA).

If you require a suppressed scale or input, you may use the following equations to determine the proper settings for \( rSCL \) and \( rSCH \).

\[
K = \frac{(\text{Highest desired scale reading} - \text{Lowest desired scale reading})}{(\text{Maximum desired analog signal} - \text{Minimum desired analog signal})} \\
\]

\[
rSCH = ((\text{Maximum possible analog signal} - \text{Maximum desired analog signal}) \cdot K) + \text{Highest desired analog reading} \\
rSCL = \text{Lowest desired scale reading} - ((\text{Minimum desired analog signal}) \cdot K). \\
\]

Operation is simple. Make sure that a valid analog signal is available to the control. In the Secondary Menu set the \( rSPt \) to On. The REM indicator on the front of the control will turn on. When the control returns to the HOME position, the displayed SV will be the value supplied from the analog remote signal. If the analog remote signal fails or goes out of range of the SPL or SPH settings, the control will revert to the internal SP1 (or #SP1), and flash the error message CHEC \( rSPt \). If SPL or SPH are set outside of rSCL or rSCH then the error will be suppressed, and the control will attempt to work with the remote value.

To clear the error message, change \( rSPt \) to OFF.

Option -PV1, -PV2, Analog Retransmission.

The analog retransmission option allows the Process Variable or the Set Variable to be sent as an analog signal to an external device. The signal may be either 0 to 10 VDC (Option -PV2) or 0 (or 4) to 20 mA (Option -PV1). The output may be changed in the field from one to the other by the toggle switch located on the top printed circuit board.

Wire the output as shown on page 7.
To set up the analog retransmission, first determine the scale range that the analog signal will represent. The maximum scale is 9999°F, 5530°C, or 9999 counts. In the Secondary Menu set POL for the scale value that will be represented by the low end of the analog signal (0 Volts or 0 mA). Set POH for the scale value that will be represented by the high end of the analog signal (10 Volts or 20 mA).

If you require a suppressed scale or output, you may use the following equations to determine the proper settings for POL and POH.

\[ K = \frac{\text{Highest desired scale reading} - \text{Lowest desired scale reading}}{\text{Maximum desired analog signal} - \text{Minimum desired analog signal}} \]

\[ \text{POH} = (\text{Maximum possible analog output} - \text{Maximum desired analog signal}) \times K + \text{Highest desired analog reading} \]

\[ \text{POL} = \text{Lowest desired scale reading} - (\text{Minimum desired analog output}) \times K. \]

Next select whether you want the retransmission signal to follow the Process Variable or the Set Variable. Usually the Process Variable is sent to recorders or other data acquisition devices. Usually the Set Variable is sent to other controls to be used as an analog remote set point. If you want the analog retransmission signal to follow the PV, in the Secondary Menu set POSr to InP. If you want the analog retransmission signal to follow the SV, set POSr to SPt.

Operation is automatic. There are no further programming steps required.

**Option -4SP, 4-Stage Set Point.**

The 4-stage set point option allows four different values to be used for SP1 and all of the values associated with the tunE menu items. The control will switch to a given stage when an external contact or contacts are made or opened across the appropriate terminals at the rear of the control (when SPSA, Set Point Switch Action, is set for remote, rE), or when the stage is selected from the Secondary Menu, SP (when SPSA is set for Int). When the state of a contact changes (or the stage number is changed in the Secondary Menu), the values in use are stored and the previously stored values for the new stage are used.

Wire the input as shown on page 7.

Usually the control is configured for external switching of the stages. In this case, the operation is usually automatic, selected by the external switches driven by the machine logic. If it is necessary to program the stages in advance, you may select the stage to modify with the SP menu item. When SP is changed while the SPSA is set for rE, the selected stage is displayed for modification, but only used when the appropriate contact is made.
MENU SELECTIONS

PRIMARY MENU
Press INDEX to advance to the next menu item. Press UP ARROW or DOWN ARROW to change the value in the display. Press ENTER to retain the value. If STAT (Secondary Menu) is On, the three program status menu items will precede the following.

#SP1 (Option -4SP, 4-Stage Set Point) or
SP1 Set Point 1 Adjust, Control Point 1.

SP2 Set Point 2 Adjust, Control Point 2.
**SECURE MENU**

Hold **UP ARROW & ENTER** for 5 Seconds. Press **INDEX** to advance to the next menu item. Press **UP ARROW** or **DOWN ARROW** to change the value in the display. Press **ENTER** to retain the value.

**OUTPUTS ARE DISABLED** (TURNED OFF) WHILE CONTROL IS IN SECURE MENU.

**SECr**  Security Code: See the Security Level Selection and the Password Table in this manual, in order to enter the correct password.

**InP**  Input Type: Select one of the following. Refer to the Input wiring section for the proper wiring.

<td>°F descriptor is On and temperature inputs will be displayed in actual degrees Fahrenheit.</td>
</tr>
<tr>
<td>C</td>
<td>°C descriptor is On and temperature inputs will be displayed in actual degrees Celsius.</td>
</tr>
<tr>
<td>nonE</td>
<td>°F and °C descriptors will be Off. This is only available with Current and Voltage Inputs.</td>
</tr>
</tbody>
</table>

**dPt**  Decimal Point Positioning: Select **0.00.00.00** or **0.000**. On tempera-
ture type inputs this will only effect the Process Value, SP1, SP2, ALLo, ALHi, and InPC. For Current and Voltage Inputs all Menu Items related to the Input will be affected.

0 No decimal Point is selected. This is available for all Input Types.

0.0 One decimal place is available for Type J, K, E, T, L, RTD’s, Current and Voltage Inputs.

0.00 Two decimal places is only available for Current and Voltage Inputs.

0.000 Three decimal places is only available for Current and Voltage inputs.

**InPt**  
Input Fault Timer: Select **OFF, 0.1 to 540.0 minutes**. Whenever an Input is out of range (UFL or OFL displayed), shorted, or open the timer will start. When the time has elapsed, the controller will revert to a safe condition (Output Off, Flashing Display). If **OFF** is selected, the Input Fault Timer will not be recognized (time = infinite).

**SEnC**  
Sensor Rate of Change: Select **OFF, 1 to 4000 °F, °C, or counts per 1 second period**. This value is usually set to be slightly greater than the fastest process response expected during a 1 second period, but measured for at least 2 seconds. If the process is faster than this setting, the SEnC bAd error message will appear. The outputs will then be turned off. This function can be used to detect a runaway condition, or speed up detection of an open thermocouple. Use the INDEX & ENTER keys to reset.

**SCAL**  
Scale Low: Select **100 to 9999 counts below SCAH**. The total span between **SCAL** and **SCAH** must be within 11998 counts. Maximum setting range is -1999 to +9999 counts. For Current and Voltage inputs, this will set the low range end. Viewable only for Thermocouple and RTD ranges.

**SCAH**  
Scale High: Select **100 to 9999 counts above SCAL**. The total span between **SCAL** and **SCAH** must be within 11998 counts. Maximum setting range is -1999 to +9999 counts. For Current and Voltage inputs, this will set the high range end. Viewable only for Thermocouple and RTD ranges.

**SPL**  
Set Point Low: Select from the lowest input range value to **SPH** value. This will set the minimum SP1 or SP2 value that can be entered. The value for SP1 or SP2 will not stop moving when this value is reached.
SPH  Set Point High: Select from the highest input range value to SPL value. This will set the maximum SP1 or SP2 value that can be entered. The value for SP1 or SP2 will not stop moving when this value is reached.

S1St  Set Point 1 State: Select dir or rE.
   dir  Direct Action. As the input increases the output will increase. Most commonly used in cooling processes.
   rE  Reverse Action. As the input increases the output will decrease. Most commonly used in heating processes.

If Out1 is set for ##tP, #PUL, or ProP, then S1OL and S1OH (following) appear. If Out1 is set for ONOF, then skip to S1rE.

S1OL  Set Point Output Low Limit: Select 0 to 100% but not greater than S1OH. This item limits the lowest output value. This is useful for adding a bias to the process when needed. Factory set to 0 for output codes 1, 2, and 3. Factory set to 20 for output code 5 (20% output equals 4 mA output).

S1OH  Set Point 1 Output High Limit: Select 0 to 100% but not less than S1OL. This item limits the highest output value. Select 0 to 102% but not less than S1OL for output code 5. This item allows setting the maximum output limit. This is useful with processes that are over powered. Adjustment to 102% allows setting current output to force a full on condition for output devices which do not have bias adjustments. Factory set to 100 for all output codes.

If Out1 is set for ##tP, #PUL, or ProP, then skip to S1LP below.

S1rE  Set Point 1 Reset. Select OnOF or Hold.
   OnOF  Control will automatically reset when process passes back through SP1d.
   HoLd  Manual Reset. Reset (acknowledge) by simultaneously pressing the INDEX & DOWN ARROW keys for 5 seconds.

S1Pi  Set Point 1 Power Interrupt. Select On or OFF.
   On   Alarm Power Interrupt is On. Control will automatically reset on power-up if no alarm condition exists.
   OFF  Alarm Power Interrupt is OFF. Control will power-up in alarm condition regardless of condition of process.
S1iH Set Point 1 Inhibit: Select On or OFF.
On Alert Inhibit is On. Alarm action is suspended until the
process value first enters a non-alarm condition.
OFF Alert Inhibit is OFF.

S1LP Set Point Lamp: Select On or Off.
On Lamp ON when Output is ON.
Off Lamp OFF when Output is ON.

S2t Set Point 2 type: Select Abs or Dev.
Abs Absolute SP2. SP2 is independent of SP1, and may be set
anywhere between the limits of Spl and SPH.
Dev Deviation SP2. SP2 is set as a deviation from SP1, and
allows SP2 to retain its relationship with SP1 when SP1 is
changed (tracking SP2).

S2St Set Point 2 State: Select dir or Re.
dir Direct Action. As the input increases the output will
increase. Most commonly used in cooling processes.
re Reverse Action. As the input increases the output will
decrease. Most commonly used in heating processes.

If Out2 is set for #tP, #PUL, or ProP, then S2OL and S2OH (following) appear. If Out2 is set for ONOF, then skip to S2rE.

S2OL Set Point Output Low Limit: Select 0 to 100% but not greater than
S2OH. This item limits the lowest output value. This is useful for
adding a bias to the process when needed. Factory set to 0 for
output codes 1, 2, and 3. Factory set to 20 for output code 5 (20%
output equals 4 mA output).

S2OH Set Point 1 Output High Limit: Select 0 to 100% but not less than
S2OL for output codes 1, 2, or 3. Select 0 to 102% but not less than
S2OL for output code 5. This item allows setting the maximum
output limit. This is useful with processes that are over powered.
Adjustment to 102% allows setting current output to force a full on
condition for output devices which do not have bias adjustments.
Factory set to 100 for all output codes.

S2rE Set Point 2 Reset. Select OnOF or Hold.
OnOF Control will automatically reset when process passes
back through SP2d.
Hold Manual Reset. Reset (acknowledge) by simultaneously
pressing the INDEX & DOWN ARROW keys for 5
seconds.
S2Pi  Set Point 2 Power Interrupt. Select On or OFF.
On  Alarm Power Interrupt is On. Control will automatically reset on power-up if no alarm condition exists.
OFF  Alarm Power Interrupt is OFF. Control will power-up in alarm condition regardless of condition of process.

S2iH  Set Point 2 Inhibit: Select On or OFF.
On  Alarm Inhibit is On. Alarm action is suspended until the process value first enters a non-alarm condition.
OFF  Alarm Inhibit is OFF.

S2LP  Set Point 2 Lamp: Select On or Off.
On  Lamp ON when Output is ON.
OFF  Lamp OFF when Output is ON.

ALARM TYPE AND ACTION (if present)

Caution: In any critical application where failure could cause expensive product loss or endanger personal safety, a redundant limit controller is required.

When setting an alarm value for an absolute alarm (A#t = AbS), simply set the value at which the alarm is to occur.

When setting the alarm value for a deviation alarm (A#t = dE), set the difference in value from the Set Point (SP) desired. For example if a low alarm is required to be 5 degrees below the SP, then set A#Lo to -5. If a high alarm is required 20 degrees above the SP, then set A#Hi to +20. If SP is changed, the alarm will continue to hold the same relationship as originally set.

The following diagram (next page) shows the action and reset functions for both absolute and deviation alarms.

When Alarm Power Interrupt, A#Pi, is programmed ON and Alarm Reset, A#rE, is programmed for Hold, the alarm will automatically reset upon a power failure and subsequent restoration if no alarm condition is present.

If Alarm Inhibit, A#iH, is selected ON, an alarm condition is suspended upon power up until the process value passes through the alarm set point once. Alarm inhibit can be restored as if a power up took place by pressing both the INDEX and ENTER keys for 5 seconds.
Warning: Resetting a high alarm inhibit will not cause an alarm to occur if the Process Value does not first drop below the high alarm setting. Do not use the Alarm Inhibit feature if a hazard is created by this action. Be sure to test all combinations of high and low alarm inhibit actions before placing control into operation.

The following menu items apply only to the alarm.

**AL1**  
Alarm 1 function: Select **OFF**, **Lo**, **Hi**, **HiLo**, or **Evnt**.  
**OFF**  
Alarm 1 is disabled. No Alarm 1 menu items appear in the Secondary or Secure menus.

**Lo**  
Low Alarm Only. **A1Lo** appears in the Secondary Menu.

**Hi**  
High Alarm Only. **A1Hi** appears in the Secondary Menu.

**HiLo**  
High and Low Alarms. Both **A1Lo** and **A1Hi** appear in the Secondary Menu, and share the same Alarm 1 Relay output.

**Evnt**  
Alarm 1 is controlled by the Ramp/Soak program function. See pages 10-13, and 20 (#A1) for further information.

If **AL1** is set to **OFF**, go to **AL2** below. If **AL1** is set to **Evnt**, go to **A1St** below.

**A1t**  
Alarm 1 Type: Select **AbS** or **dE**

**AbS**  
Absolute Alarm that may be set anywhere within the values of **SCAL** and **SCAH** and is independent of **SP1**.

**dE**  
Deviation Alarm that may be set as an offset from **SP1**. As **SP1** is changed the Alarm Point will track with **SP1**. A deviation alarm will also track any active ramp or soak set point.
A1rE  Alarm 1 Reset: Select OnOF or Hold.
OnOF  Automatic Reset.
Hold  Manual Reset. Reset (acknowledge) by simultaneously pressing the INDEX & DOWN ARROW keys for 5 seconds.

A1Pi  Alarm 1 Power Interrupt: Select On or OFF.
On    Alarm Power Interrupt is On.
OFF   Alarm Power Interrupt is OFF.

A1iH  Alarm 1 Inhibit: Select On or OFF.
On    Alarm Inhibit is On. Alarm action is suspended until the process value first enters a non-alarm condition.
OFF   Alarm Inhibit is OFF.

A1St  Alarm 1 Output State: Select CLOS or OPen.
CLOS  Closes Contacts at Alarm Set Point.
OPen  Opens Contacts at Alarm Set Point.

A1LP  Alarm 1 Lamp: Select O on or OoFF.
O on  Alarm Lamp is ON when alarm contact is closed.
OoFF  Alarm Lamp is OFF when alarm contact is closed.

A1Lb  Alarm 1 Loop Break. Select On or OFF.
On    Loop Break Condition will cause an Alarm Condition.
OFF   Loop Break will not affect the Alarm Condition.

AL2  Alarm 2 function: Select OFF, Lo, Hi, HiLo, or Evnt.
OFF   Alarm 2 is disabled. No Alarm 2 menu items appear in the Secondary or Secure menus.
Lo    Low Alarm Only. A2Lo appears in the Secondary Menu.
HiLo  High and Low Alarms. Both A2Lo and A2Hi appear in the Secondary Menu, and share the same Alarm 2 Relay output.
Evnt  Alarm 2 is controlled by the Ramp/Soak program function. See pages 10-13, and 20 (#A2) for further information.

If AL2 is set to OFF, the Secure Menu ends. If AL2 is set to Evnt, go to A2St below.

A2t   Alarm 2 Type: Select AbS or dE
AbS   Absolute Alarm that may be set anywhere within the values of SCAL and SCAH and is independent of SP1.
Deviation Alarm that may be set as an offset from SP1. As SP1 is changed the Alarm Point will track with SP1. A deviation alarm will also track any active ramp or soak set point.

**A2rE**  
Alarm 2 Reset: Select **OnOF** or **Hold**.
- **OnOF**: Automatic Reset.
- **Hold**: Manual Reset. Reset (acknowledge) by simultaneously pressing the INDEX & DOWN ARROW keys for 5 seconds.

**A2Pi**  
Alarm 2 Power Interrupt: Select **On** or **OFF**.
- **On**: Alarm Power Interrupt is **On**.
- **OFF**: Alarm Power Interrupt is **OFF**.

**A2iH**  
Alarm 2 Inhibit: Select **On** or **OFF**.
- **On**: Alarm Inhibit is **On**. Alarm action is suspended until the process value first enters a non-alarm condition.
- **OFF**: Alarm Inhibit is **OFF**.

**A2St**  
Alarm 2 Output State: Select **CLOS** or **OPEN**.
- **CLOS**: Closes Contacts at Alarm Set Point.
- **OPEN**: Opens Contacts at Alarm Set Point.

**A2LP**  
Alarm 2 Lamp: Select **O on** or **OOff**.
- **O on**: Alarm Lamp is ON when alarm contact is closed.
- **OOff**: Alarm Lamp is OFF when alarm contact is closed.

**A2Lb**  
Alarm 2 Loop Break. Select **On** or **OFF**.
- **On**: Loop Break Condition will cause an Alarm Condition.
- **OFF**: Loop Break will not affect the Alarm Condition.

**SPSA**  
*(Option -4SP, 4-Stage Set Point) Switch Action: Select **rE** or **Int**.*
- **rE**: Set Point Stage selected by external contact closures.
- **Int**: Set Point Stage selected by internal menu selection. See SP menu item in Secondary Menu.
SECONDARY MENU

Hold UP ARROW & ENTER. Press INDEX to advance to the next menu item. Press UP ARROW or DOWN ARROW to change the value in the display. Press ENTER to retain the value.

A1Lo  Alarm 1 Low: The Low Alarm point is usually set below the Set Point. May not appear depending on AL1 setting in Secure Menu.

A1Hi  Alarm High: The High Alarm Point is usually set above the Set Point. May not appear depending on AL1 setting in Secure Menu.

A2Lo  Alarm 2 Low: The Low Alarm point is usually set below the Set Point. May not appear depending on AL2 setting in Secure Menu.

A2Hi  Alarm 2 High: The High Alarm Point is usually set above the Set Point. May not appear depending on AL2 setting in Secure Menu.

Out1  Output selection: Select OnOf, 1tP, 1PuL, or ProP.

ONOF  A setting of ONOF allows the control to operate as a simple on/off mode. This setting forces the control to turn off at set point, and on at the set point plus the differential (SP_d). When selected, the Out1/OnOF menu item is followed by ####/SP1d, and the tunE, Pb, rES, OFS, rtE, and ArUP selections in the Secondary menu and the S1OL and S1OH selections in the Secure menu are suppressed.

SP_d  Set Point On-Off Differential (hysteresis). Select 1 to 9999 (direct acting), or -1 to -9999 (reverse acting). This value will be negative for reverse acting set points, and positive for direct acting.
acting outputs. Set the value for the amount of difference between the turn off point (set point) and the turn on point. The following drawing shows output behavior for reverse and direct action.

---

##tP

Time Proportioning Cycle Time. Select 1tP to 80tP.  

1tP  A setting of 1tP is recommended for solid state outputs (SSR or 15VDC).

2tP to 80tP  Time Proportioning Control is adjustable in 1 second steps. Recommended for mechanical outputs (relays, solenoids, etc.). For best contact life, a time should be selected as long as possible without causing the process to wander.

#PuL  Pulsed Time Proportioning Output: Select 1PuL to 7PuL. 1PuL = Linear and 7PuL = most nonlinear. Changes output linearity for use in cooling applications or for an extremely fast response processes. At the center of the proportional band, a pulse value of 1 provides an output of one second on and one second off (50% output). A pulse value of 2 provides an output of one second on and two seconds off (33% output). Output at center of band equals one second on, 2(pulse value - 1) seconds off.

ProP  For Current (Code 5) outputs only.

The following menu items apply only if your control is equipped with a second set point (last digit of model number is not zero). If your control does not have a second set point, jump to the “tunE” menu on the next page.

Out2  Output selection: Select OnOF, 2tP, 2PuL, or ProP.  

ONOF  A setting of ONOF allows the control to operate as a simple on/off mode. This setting forces the control to turn off at set point, and on at the set point plus the differential (SP2d). When selected, the Out2/OnOF
menu item is followed by #/SP2d, and the Pb2 selection in the Secondary menu and the S2OL and S2OH selections in the Secure menu are suppressed.

**SP2d** Set Point On-Off Differential (hysteresis). Select 1 to 9999 (direct acting), or -1 to -9999 (reverse acting). This value will be negative for reverse acting set points, and positive for direct acting outputs. Set the value for the amount of difference between the turn off point (set point) and the turn on point. The drawing opposite shows output behavior for reverse and direct action.

---

**#tP** Time Proportioning Cycle Time. Select 1tP to 80tP. 
1tP A setting of 1tP is recommended for solid state outputs (SSR or 15VDC).
2tP to 80tP Time Proportioning Control is adjustable in 1 second steps. Recommended for mechanical outputs (relays, solenoids, etc.). For best contact life, a time should be selected as long as possible without causing the process to wander.

**#PuL** Pulsed Time Proportioning Output: Select 1PuL to 7PuL. 1PuL = Linear and 7PuL = most nonlinear. Changes output linearity for use in cooling applications or for an extremely fast response processes. At the center of the proportional band, a pulse value of 1 provides an output of one second on and one second off (50% output). A pulse value of 2 provides an output of one second on and two seconds off (33% output). Output at center of band equals one second on, $2(pulse\ value-1)$ seconds off.

---

**ProP** For Current (Code 5) outputs only.

---

**SP** (Option -4SP, 4-Stage Set Point) Active Set Point Stage. Select 1SP1, 2SP1, 3SP1, 4SP1.

1SP1 Set Menu Items to display Stage 1 for view and change access. If SPSA is set for Int. 1SP1 is made active.

2SP1 Set Menu Items to display Stage 2 for view and change access. If SPSA is set for Int. 2SP1 is made active.

3SP1 Set Menu Items to display Stage 3 for view and change access. If SPSA is set for Int. 3SP1 is made active.

4SP1 Set Menu Items to display Stage 4 for view and change access. If SPSA is set for Int. 4SP1 is made active.
#SP1  (Option -4SP, 4-Stage Set Point) Adjust Control Point 1 for Stage selected above.

Note: The menu items for tunE (below) are modified when Option -4SP is in use. When Option -4SP is active the menu items are preceeded with the stage number selected in SP above. The stage number is noted here with the # sign. When the 4 Stage Set Point option (-4SP) is active, each stage has its own set of tunE parameters.

#tun  (Option -4SP, 4-Stage Set Point) or

tunE  Tuning Choice: Select SELF, Pid, SLO, nor, or FAST.

SELF  The Controller will evaluate the Process and select the PID values to maintain good control. Active for SP1 only.

LErn  Select YES or no

YES  Start Learning the Process. After the process has been learned the menu item will revert to no.

no  Learning will stay in present mode.

dFAC  Damping factor, Select OFF, 1 to 7. Sets the ratio of Rate to Reset for the SELF tunE mode. 7 = most Rate. Factory set to 3. For a fast response process the value should be lowered (less Rate). For a slower process the value should be increased (more Rate).

Pid  Manually adjust the PID values. PID control consists of three basic parameters, Proportional Band (Gain), Reset Time (Integral), and Rate Time (Derivative).

#Pb1  (Option -4SP, 4-Stage Set Point) or

Pb1  Proportional Band (Bandwidth). Select 1 to 9999 °F, °C, or counts.

Pb2  Proportional Band (Bandwidth). Select 1 to 9999 °F, °C, or counts. Appears only if control is equipped with second set point and Out2 is NOT selected as ONOF.

#rES  (Option -4SP, 4-Stage Set Point) or

rES  Automatic Reset Time. Select OFF, 0.1 to 99.9 minutes. Select OFF to switch to OFS.

#OFS  (Option -4SP, 4-Stage Set Point) or

OFS  Manual Offset Correction Select OFF, 0.1 to 99.99%. Select OFF to switch to rES.

SLO  PID values are preset for a slow response process.

nor  PID values are preset for a normal response process.
FAST  PID values are preset for a fast response process.

Pid2  Linkage of PID parameters between SP1 and SP2: Select On or OFF.
  On   Applies SP1 rEs, rtE, Fbnd, and FrtE terms to SP2 for heat/cool applications.
  OFF  SP2 functions without rEs, rtE, Fbnd and FrtE.

ArUP  Anti-Reset Windup Feature: Select On or OFF.
  On   When ArUP is On the accumulated Reset Offset value will be cleared to 0% when the process input is not within the Proportional Band.
  OFF  When ArUP is OFF, the accumulated Reset Offset Value is retained in memory when the process input is not within the Proportional Band.

ArtE  Approach Rate Time: Select OFF, 0.01 to 99.99 minutes. The function defines the amount of Rate applied when the input is outside of the Proportional Band. The ArtE time and the rtE time are independent and have no effect on each other. To increase damping effect and reduce overshoot set the approach rate time for a value greater than the natural rise time of the process (natural rise time = process value time to set point).

Fint  Fuzzy Logic Intensity: Select 0 to 100%. 0% is OFF (disables Fuzzy Logic). The function defines the amount of impact Fuzzy Logic will have on the output.

Fbnd  Fuzzy Logic Error Band: Select 0 to 4000 °F, °C, or counts. Sets the bandwidth of the Fuzzy Logic. Set Fbnd equal to PID proportional band (Pb1) for best results.

FrtE  Fuzzy Logic Rate of Change: Select 0.00 to 99.99 counts/second. For best initial setting, find the count/second change of process value near set point 1 with output ON 100%. Multiply this value by 3. Set FrtE to this calculated value.

PEA   The Peak feature stores the highest input the control has measured since the last reset or Power On. At Power On PEA is reset to the present input. To manually reset the value PEA must be in the lower display. Press the ENTER key to reset. PEA will be reset and display the present input value.

UAL  The Valley feature stores the lowest input the Instrument has measured since the last reset or Power On. At Power On UAL is reset
to the present input. To manually reset the value UAL must be in the lower display. Press the ENTER key. UAL will be reset and display the present input value.

**PctO**  
Percent Output Feature: Select **On** or **OFF**.  
**On**  
When selected **On**, the HOME lower display will indicate the output of the controller in percent. An “O” will appear in the right hand side of the lower display to indicate percent output for SP1. An “O" will appear on the right hand corner of the lower display to represent percent output for SP2, if the control is so equipped. The display will alternate between these values.  
**OFF**  
Percent Output display is disabled.

**Prog**  
Ramp/Soak Feature: Select **On** or **OFF**  
**On**  
Allows Programmed Ramp/Soak function to be started by the Run/Hold key on the control front panel.  
**OFF**  
Turns Ramp/Soak function **OFF** and resets program to beginning.

**PSEt**  
Programmer function set. Select **On** or **OFF**.  
**Off**  
Skip Ramp/Soak Programming. Go to next Secondary Menu Item, InPC on the next page.  
**On**  
Enable Ramp/Soak Programming.

**StAt**  
Programmer Status Display in the Primary Menu when Prog (above) is **On**: Select **On** or **OFF**.  
**OFF**  
The Primary Menu operates as normal.  
**On**  
The Primary Menu is altered to have the following items inserted before the SP1 menu item: ####/ti (time remaining in segment), ####/#ti (total time in active segment), and ####/##SP (segment target set point).

**tbAS**  
Ramp/Soak Time Base. Select **1_S** or **60_S**.  
**1_S**  
Ramp/Soak time base is in 1 second increments. Program time 1ti...16ti is measured in seconds.  
**60_S**  
Ramp/Soak time base is in 60 second increments (minutes). Program time 1ti...16ti is measured in minutes.

The following items repeat in the following order: 1ti, 1SP, 1A1 (if alarm 1 is programmed as an event), 1A2 (if alarm 2 is programmed as an event), 2ti, 2SP, 2A1, 2A2, . . . , 16ti, 16SP, 16A1, 16A2. To avoid repetition each item will only be described once.
1ti  Segment Time: Select 0 to 9999 units (minutes if tbaS is set to 60_S, seconds if tbaS is set to 1_S).

1SP  Segment Set Point Adjust.

1A1  Segment Alarm 1 Event: Select On or OFF.
   On  Alarm 1 is active during segment 1 time (1ti).
   OFF Alarm 1 is inactive during segment 1 time (1ti).

1A2  Segment Alarm 2 Event: Select On or OFF.
   On  Alarm 2 is active during segment 1 time (1ti).
   OFF Alarm 2 is inactive during segment time (1ti).

PEnd  Program End action: Select Hold or Off.
   Hold  Stay at the Present Set Point (16SP).
   Off  Turn Off SP1 and SP2 Outputs at the end of the program.
   Loop  Repeat program starting at 1ti.
   SP1  Revert to SP1 value.

InPC  Input Correction: Select ±500 °F, °C, or counts. This feature allows the input value to be changed to agree with an external reference or to compensate for sensor error. Note: InPC is reset to zero when the input type is changed, or when decimal position is changed.

FiLt  Digital Filter: Select OFF, 1 to 99. In some cases the time constant of the sensor, or noise could cause the display to jump enough to be unreadable. A setting of 2 is usually sufficient to provide enough filtering for most cases, (2 represents approximately a 1 second time constant). When the 0.1 degree resolution is selected this should be increased to 4. If this value is set too high, controllability will suffer.

LPbr  Loop Break Protection: Select OFF, 1 to 9999 seconds. If, during operation, the output is minimum (0%) or maximum (100%), and the input moves less than 5°F (3°C) or 5 counts over the time set for LPbr, the LOOP bAd message will appear. This condition can also be routed to an Alarm Condition if alarms are present and turned On (see ALbr in the secure menu). The loop break error can be reset by pressing the ENTER key when at the LPbr menu item. The INDEX & ENTER keys may also be used.

POL  (Option -PV1, -PV2, Analog Retransmission Output) Process Output Low: Select -450°F, -260°C, or -1999 counts to any value less than POH.
**POH**  (Option -PV1, -PV2, Analog Retransmission Output) Process Output High: Select from any value greater than **POL** to +9999°F, +5530°C, or 9999 counts.

**POSr**  (Option -PV1, -PV2, Analog Retransmission Output) Process Output Source: Select **InP** or **SPt**.
- **InP**  Process output follows the Process Variable (input).
- **SPt**  Process Output follows the Set Variable (SP1).

**rSPt**  (Option -RSP2, -RSP1 Analog Remote Set Point) Remote Set Point: Select **On** or **OFF**.
- **OFF**  The control uses the value set for **SP1**.
- **On**  The control uses the value set by the analog remote set point signal as established by the Secure Menu items **rSCL** and **rSCH**. If the analog signal fails, the control will display the error message **CHEC/ LorE** and revert to the **SP1** local value.
## Diagnostic Error Messages

<table>
<thead>
<tr>
<th>Display</th>
<th>Meaning</th>
<th>SP Outputs</th>
<th>Action Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>UFL or OFL</td>
<td>Underflow or Overflow: Process value has exceeded input range ends.</td>
<td>Set point outputs active, alarms active.</td>
<td>Input signals may normally go above or below range ends. If not, check input and correct.</td>
</tr>
<tr>
<td>bAd InP</td>
<td>UFL or OFL will sequence to display one of these messages if the InPt is set for a time value.</td>
<td>Set point outputs inactive, alarms active.</td>
<td>To reset use the INDEX &amp; ENTER keys. When InPt (input fault timer) has been set for a time, the outputs will be turned off after the set time. Setting the time to OFF causes the outputs to remain active, however UFL or OFL will still be displayed. Correct or replace sensor. To reset use the INDEX &amp; ENTER keys.</td>
</tr>
<tr>
<td>OPEN InP</td>
<td>For RTD inputs RTD is open or shorted.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>For THERMOCOUPLE inputs thermocouple is open.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LOOP bAd</td>
<td>The sensor may be defective, heater fuse open, heater open, or the final power output device is bad.</td>
<td>Set point outputs inactive, alarms active.</td>
<td>Correct or replace sensor, or any element in the control loop that may have failed. Correct the problem, and reset the control by pressing the INDEX and ENTER keys, or index to LPbr and press ENTER.</td>
</tr>
<tr>
<td>SEnC bAd</td>
<td>Sensor Rate of Change exceeded the programmed limits set for SEnC.</td>
<td>Set point outputs inactive, alarms active.</td>
<td>Check for the cause of the error. The value setting may be too slow for the process, or the sensor is intermittent. Correct the problem and press INDEX and ENTER to reset.</td>
</tr>
<tr>
<td>CHEC CAL</td>
<td>Check calibration appears as an alternating message if the instrument calibration nears tolerance edges.</td>
<td>Set point outputs active, alarms active.</td>
<td>Remove the instrument for service and / or recalibration. To reset use the INDEX &amp; ENTER keys.</td>
</tr>
<tr>
<td></td>
<td>Check calibration appears as a flashing message if the instrument calibration exceeds specification.</td>
<td>Set point outputs inactive, alarms active.</td>
<td>Remove the instrument for service and / or recalibration. To reset use the INDEX &amp; ENTER keys.</td>

## Diagnostic Error Messages

<table>
<thead>
<tr>
<th>Display</th>
<th>Meaning</th>
<th>SP Outputs</th>
<th>Action Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>No display lighted</td>
<td>Display is blank. Instrument is not getting power, or the supply voltage is too low.</td>
<td>Set point outputs inactive</td>
<td>Check that the power supply is on, or that the external fuses are good.</td>
</tr>
<tr>
<td>FAIL tEst</td>
<td>Fail test appears upon power up if the internal diagnostics detect a failure. This message may occur during operation if a failure is detected. Displays flash.</td>
<td>Set point outputs inactive</td>
<td>The display alternate between FAIL tEst and one of the following messages: FACT dFLt: Memory may be corrupted. Press the ENTER key and the DOWN ARROW key to start the factory default procedure. Recheck controller programming. rEt FACT: Unrecoverable error, return to factory for service.</td>
</tr>
<tr>
<td>CHEC SP1, SP2, ...</td>
<td>This message will appear upon power up if SP1, SP2, #SP1, or ##SP is set outside of the SPL or SPH values.</td>
<td>Set point outputs inactive</td>
<td>Correct the SP1, etc. or adjust the SPL or SPH values by programming new values.</td>
</tr>
<tr>
<td>CHEC SPL or SPH</td>
<td>This message appears at power up if SPL or SPH values are programmed outside the input range ends.</td>
<td>Set point outputs inactive</td>
<td>Correct the SPL or SPH values by programming new values.</td>
</tr>
<tr>
<td>CHEC rSppt</td>
<td>This message appears if the analog remote set point signal is out of range.</td>
<td>Set point outputs active</td>
<td>The control will revert to SP1. Correction of the analog signal allows the control to return to the remote</td>
</tr>
<tr>
<td>CHEC LorE</td>
<td>This message appears if the Serial Communications has timed out.</td>
<td>Set point outputs active</td>
<td>Restore the communications line and switch the LorE to LOC.</td>
</tr>
</tbody>
</table>
SPECIFICATIONS

Selectable Inputs: Thermocouple, RTD, DC Voltage, or DC Current selectable.

Input Impedance:
Thermocouple = 3 megohms minimum. RTD current = 200 µA.
Current = 10 ohms. Voltage = 5000 ohms.

Sensor Break Protection: De-energizes control output to protect system after customer set time. (See InPt in Secondary Menu.)

Set Point Range: Selectable (See Range Chart Page 39).

Display: Two 4 digit, 7 segment 0.56” high LEDs.

Control Action: Reverse (usually heating), Direct (usually cooling) selectable.

Proportional Band: 1 to 9999 °F, °C, or counts.
Reset Time (Integral): Off or 0.1 to 99.9 minutes.
Rate Time (Derivative): Off or 0.01 to 99.99 minutes.
Cycle Rate: 1 to 80 seconds.
On - Off Differential: Adjustable 1° F, 1° C, or 1 count to full scale in 1° F, 1° C, or 1 count steps.
Alarm On - Off Differential: 1° F, 1° C, or 1 count.
Fuzzy Percent: 0 to 100%.
Fuzzy Rate: Off or 0.01 to 99.99 minutes.
Fuzzy Band: Off or 1 to 4000 °F, °C, or counts.
Accuracy: ±0.25% of span, ±1 least significant digit.
Resolution: 1 degree or 0.1 degree, selectable.

Line Voltage Stability: ±0.05% over the supply voltage range.
Temperature Stability: 4µV/°C (2.3 µV/°F) typical, 8 µV/°C (4.5 µV/°F) maximum (100 ppm / °C typical, 200 ppm / °C maximum).
Common Mode Rejection: 140 db minimum at 60 Hz.
Normal Mode Rejection: 65 db typical, 60 db at 60 Hz.
Isolation:
Relay and SSR outputs: 1500 VAC to all other inputs and outputs.
SP1 and SP2 Current outputs: 500 VAC to all other inputs and outputs, but not isolated from each other.
SP1 and SP2 Switched Voltage outputs: 500 VAC to all other inputs and outputs, but not isolated from each other.
24 VDC Loop Power: 500 VAC to all inputs and outputs.
Process Output: 500 VAC to all other inputs and outputs.

Page 37
Supply Voltage: 100 to 240 VAC, nominal., +10 -15%, 50 to 400 Hz. single phase; 132 to 240 VDC, nominal., +10 -20%.

Power Consumption: 5VA maximum.

Operating Temperature: -10 to +55 °C (+14 to 131 °F).

Storage Temperature: -40 to +80 °C (-40 to 176 °F).

Humidity Conditions: 0 to 90% up to 40 °C non-condensing 10 to 50% at 55 °C non-condensing.

Memory Backup: Nonvolatile memory. No batteries required.

Control Output Ratings:
  SSR: 2.5 A @ 240 VAC at 25 °C (77°F). Derates to 1.25 A @ 55° C (130°F).
  Relay: SPDT, 10 A @ 240 VAC resistive; 1/4 hp @ 120 VAC, 1/3 hp @ 240 VAC.
  Alarm Relay: SPST, 3 A @ 240 VAC resistive; 1.5 A @ 240 VAC inductive; Pilot Duty Rating: 240 VA, 2 A @ 125 VAC or 1 A @ 240 VAC.
  Current (isolated): 0 to 20 mA across 600 ohms maximum.
  Switched Voltage (isolated): 15 VDC @ 20 mA.

Loop Power Supply (isolated): 24VDC @ 50mA, regulated.

Panel Cutout: 45 mm x 45 mm (1.775” x 1.775”).

Depth Behind Mounting Surface: 115.3 mm (4.54”).

Weight: 454 g (16 oz).

### Process Input Types

The 0 to 20 mADC, 4 to 20 mADC, 0 to 10 VDC, 2 to 10 VDC, and -10 to +10 mVDC inputs are fully scalable from a minimum of 100 counts span placed anywhere within the range of -1999 to +9999. Decimal point position is adjustable from the zero place (9999), tenths (999.9), hundredths (99.99), thousandths (9.999), or ten thousandths (.9999).
DIMENSIONS

MEETS IP66 (TYPE 4X)

Panel cut out for all models 92mm X 92 mm
(3.625" X 3.625"). Allow for 13 mm (0.5") clearance
at the rear of the control.
